Very simple, some of the guys who made tha Atari 8-bit range,
quitted, got sacked, whatever, started an indipendent company
made the Amiga computer, tried to sell it to atari, well atari fucked up,
so commodore bought the amiga instead..

enjoy...

Message-ID: <C4E3st.6C@cck.coventry.ac.uk>
Source record: 208412

Thanks to all those that sent a reply about my quest to get the hard disk working. Its apears that the HD needs reformatting.

Its the general opinion that 2 programs are required:

AHDI.PRG (Or similar)
HINSTALL.PRG

Its seems that these are available via FTP.
One slight snag, we can't use FTP at the moment (At Coventry Uni), so i would be grateful if some top class man, could send me them via E-Mail.

Thanks again,

Steve.

>last printer was from '82.. :)
>

This came up on c.s.a.st.tech t'other day - you need a utility to download fonts to the printer. I know of two programs that do it, though I'm sure theree must be more. One is IdeaList - a German PD printing utility (and very nice it is too - multiple columns, print to file, that sort of thing) that supports the Laserjet II. The other is Fontprint - Part of Fontkit, the commercial font manipulation package. This supports menus for selecting up to 5 (I think) soft fonts, and has its own print routines for ascii text or works with Gem applications such as First Word Plus, Redacteur etc (anyone tried it with Protext ?). Both come as accessory or stand-alone versions.

ANy 300dpi font should be OK - Deskjet, Atari Laser, that sort of thing. Fontkit would allow you to convert other fonts to the right rez too (what a sales pitch !).

4577. Looking for graphing programs

Newsgroup: comp.sys.atari.st
Date: 1993-03-24 11:38:02 UTC
From: kisaacso@nyx.cs.du.edu
Message-ID: <1993Mar24.113802.4027@mnemosyne.cs.du.edu>
Source record: 208413

Well, the subject says it all so I'll be brief. I'm looking for graphing programs for the ST, specifically a program that will generate a pie graph. My inital search of a.a.u.e turned up nothing unless one of the spreadsheet programs there has this capability. Any help is appreciated, if pd or shareware is not available tell me the name of the commercial package that will let me do this. My local Atari dealer is just down the street and Atari software is becoming increasingly inexpensive :(

^^^^^^^^^^^-false! look at the list below

Yep, you can FTP GVIEW213.LZH, which is shareware, at

puffin.doc.ic.ac.uk (146.169.1.3)
in /computing/systems/atari/umich/Graphics

This program (or accessory) runs on ST/TT (in any res) and maybe also on
FALCON and can handle following formats (extract of the accompanying doc):

"GEM-View images [*.GVW]" (internes Format)
"TIFF Format [*.TIF]"
"GIF Images 87/89 [*.GIF]"
"JPEG Images [*.JPG]"
"Sun Rasterfiles [*.SUN]"
"Imagelab Images [*.B&W]
"STAD Images [*.PAC]"
"IFF Imagefiles [*.IFF]"
"HAM Hold & Modify [*.IFF]"
"MS-Windows Bitmap (*.BMP, *.RLE)"
"OS/2 Bitmap (*.BMP)"
"GEM-(X)Image Files (*.IMG)"
"GEM-Metafiles (Vector) (*.GEM)"
"Neochrome Rasterfiles (*.NEO)"
"Art-Director Rasterfiles (*.ART)"
"Degas Images (*.P[IC][123])"
"Tiny-Compressed Images (*.TN[123Y])"
"Doodle Monochrome Rasters (*.DOO [640x...])"
"Spectrum 512 Images (*.SPU, *.SPC)"
"Portable Bit Map [*.P[BGP]M]"
"MacPaint Image [*.MAC]"
"PC Paintbrush (monochrom) (*.PCX)"
"X Bitmap-File [*.XBM]"
"1st Word Files [*.DOC]"
"Load as Text or Hexdump [*.*]"

Hope this helps.

Hmm. Maybe you should post it to comp.sources. Who knows some TT/Falcon
freak will actually manage to write an emulator in a window. That would
certainly be cool. Writing it on the 32MHz 68030 will certainly eliminate the
speed problems. BTW, I was impressed by the capabilities of the ZX81
emulator (including the speed), and doesn't the Z80 in the spectrum run at the
same speed as the one in the 81? Then I'd say the spectrum emulator shouldn't
be that much slower.

Here is a little suggestion for a CeBit button for those reading this group and having access to TeX and a printer. (A bit late you could say.)

Fill in you name at the obvious spots and format and print. It comes in 3 different sizes.

Well... as far as I can remember the ZX81 was a 2MHz Z80, the Spectrum was a
3.5Mhz Z80A(or B) - something like that. It was quite a bit faster anyway!
The main problem with emulation that I came across was the screen handling -
the ZX81 (with more than 3.5K) had a very simple screen layout, 768 characters,
none of this high rez graphics stuff, the Spectrum on the other hand had a
256 by 192 pixels display, with a 32 by 24 'colour attribute' map. Most of the
time on my ST emulator is converting a screen write to an equivalent ST screen
write - not a simple task (well, I didn't find it simple :-)

Andrew.

I had both, the Z80A in the Spec runs at 3.48 MHz, but I'm not sure
about the one in the ZX81. The Spectrum was a lot faster, though,
because the ZX81 was heavily loaded by the video logic. (Hence the
FAST command, turning off the screen). Wow, this brings back some good
memories, not being able to print the whole screen full due to memory
problems...

Those were the days...

4585. New Maibox-System !

Newsgroup: comp.sys.atari.st
Date: 1993-03-24 16:02:06 UTC
From: tsstoeck@cip.informatik.uni-erlangen.de
Message-ID: <1oq0luEb4d@uni-erlangen.de>
Source record: 208422

Hi there !

A new Mailbox-System is born! The SUPRIMA-System. It works on all ST/STE
TT/Falcon Computers. But the most interesting is: it runs without
blocking the Computer. Even the Up/Download can happen while the User
is working on the Computer.
The Box uses Roman Hodeks ZModem protocoll - the best I know. You can
set up the Bytes/Block from 32Bytes up to 8192Bytes/Block !!

For further information mail me.

Ciao
Atarico

==========

GEMULATOR VERSION 2.1
Press Release/Update

Branch Always Software
14150 N.E. 20th Street Suite 302
Bellevue, WA 98007, U.S.A.

- NEW FEATURES AND IMPROVEMENTS
- SMALLER HARDWARE REQUIREMENTS
- INTERNATIONAL AVAILABILITY
- SEE IT AT THE SAC SHOW
- LOWER U.S. PRICES

Branch Always Software has just released version 2.1 of the Gemulator, the Atari ST emulator for DOS and Windows compatible PCs. Gemulator allows a 386 or 486 based PC to directly run most Atari ST software (except for games and music software) and supports all versions of TOS, four different screen resolutions, and can provide up to 8 megabytes of RAM to ST programs.

Gemulator 2.1 is now available from computer dealers in Europe and North America. In the U.S. and Canada, the list price is now only $229 U.S. which includes the Gemulator board, emulation software, and U.S. TOS 2.06 ROMs.

Gemulator 2.1 is now also available in the U.K., France, Holland, and Germany. The versions sold in each of those countries contain TOS 2.06 ROMs appropriate for each country, and all documentation and software

has been fully translated.

Gemulator 2.1 will be shown at the upcoming Sacramento Atari Expo on March 13th and 14th in Sacramento, California. Come by the Branch Always Software booth and see Gemulator for yourself!

Version 2.1 has the following new features and improvements:

- the separate 386 and 486 versions of Gemulator have been combined into one single convenient version which is just as fast (or even slightly faster on some machines) than Gemulator 2.0.

- the ability to create a virtual Atari hard disk partition on any size DOS partition means that you can now safely read and write Atari files anywhere on your PC's hard disk and even over the network, without having to reformat or repartition the hard disk as before.

- a 4 megabyte PC can now emulate a full megabyte of ST RAM (up from 512K before). Gemulator can emulate up to 8 megabytes of ST RAM, double the 4 megabyte limit of the real Atari ST.

- Pagestream and some other programs now print up to 10 times faster. The actual speedup will depend on the size and contents of the Pagestream document. A full page 8.5" x 11" 300 dpi Pagestream document prints out in about 3 minutes on an HP LaserJet printer.

- the real-time clock in the ST keyboard is now emulated. This allows TOS 2.06 to boot up with the current DOS time and date.

- the "missing keystrokes" bug from Gemulator 2.0 and other bugs are fixed.

Gemulator already has several features not found in the real Atari ST, and in many ways it is much better than a real ST:

- the ability to emulate up to 8 megabytes of ST RAM (described above) makes it ideal when using a lot of GDOS fonts, running the new MultiTOS, or editing very large Calamus and Pagestream documents.

- the ability to emulate TT medium resolution (640x480 16 colors) allows most GEM based Atari ST programs to run with more colors and with better graphics than is possible on the real ST.

- switching from color to monochrome (or vice versa) is as simple as pressing one key. Forget having to use two monitors and swapping cables all the time!

- each Gemulator board can hold up to 4 sets of TOS ROMs and you can easily switch from one version of TOS to another by just pressing a few keys. This allows you to use the supplied TOS 2.06 with most of your ST software, but switch back to TOS 1.0 or TOS 1.4 for running earlier software not compatible with TOS 2.06.

- due to the ever increasing speed of PCs and the availability of the 486 DX2 clock doubler chip, you can easily upgrade your 33 Mhz 486 PC

to a 66 Mhz PC and run Atari ST software up to 3 times faster than a real ST. That's faster than a Mega STE, faster than a 20 Mhz accelerator, and in many cases, as fast as the Falcon.

Gemulator now has smaller hardware requirements. Your PC need only have the following:

- a 386 or 486 CPU
- 4 megabytes of RAM
- a 720K 3.5" floppy disk drive
- a VGA card and monitor
- 1.7 megabytes of hard disk space
- a mouse is optional but recommended

Gemulator consists of a PC board which plugs into any 8-bit or 16-bit AT-style slot. The board is used to install TOS ROMs which are needed to run Atari ST software on a PC. The emulator itself is simply copied to the hard disk and run from the DOS prompt or a DOS window just like any other PC program.

The speed of Gemulator's emulation is affected by the speed of your PC's processor, hard disk, video card, and other factors, but it is usually proportional to the speed of the processor (the 386 or 486 chip). Below is a table of various processors and the APPROXIMATE speed of emulation compared to a standard ST (which of course has a relative speed of 1.0):

386/16 - 0.3
386/33 - 0.6
386/40 - 0.8
486/25 - 0.9
486/33 - 1.2
486/50 - 1.8
486/66 - 2.4

386 based computers running slower than 33 Mhz are not recommended for use with Gemulator due to the relatively slow speed of emulation. Gemulator emulates the 68000 chip entirely in software and so a fast 386 is required.

The Gemulator package comes with a set of TOS 2.06 ROMs, but if you wish to use your own ROMs, the board and emulator can now be purchased without any TOS ROMs for $179, a $50 savings. You must of course supply your own TOS 1.0, 1.2, 1.4, 1.6 or 2.06 ROMs before being able to use Gemulator.

In the U.S. and Canada, Gemulator is distributed by:

PMC (Purple Mountain Computers)
15600 N.E. 8th Street, Unit #A3-412
Bellevue, WA 98008, U.S.A.

For ordering information, call 1-206-399-8700.

4588. NetHack 3.1.1

Newsgroup: comp.sys.atari.st
Date: 1993-03-24 17:15:52 UTC
From: christof@wowbagger.pc-labor.uni-bremen.de
Message-ID: <1993Mar24.171552.18074@informatik.uni-bremen.de>
Source record: 208424

NetHack 3.1.1 is now available from wowbagger.pc-labor.uni-bremen.de
(134.102.228.9, in pub/atari_st/games/nethack31)

This release includes:

- an ST binary that should run on any (> 1MB) machine
- a (jam-) packed version of this binary for floppy-drive-only support
- a (jam-) packed binary that runs on 1MB machines, which lacks
several of the full game's features, but retains most of the essential
3.1 additions
- a TT-only binary (68030 code - shorter, a little faster)

Also, this time the recover program will work on any machine, not
exclusively on TTs :-)

If you're not sure about which files to download, get the readme file
first, it should answer your questions.

I don't know whether the 1 meg binary will actually work through the
whole of the game (might be that NetHack will finally exhaust the
memory by mallocing too much when you're deep in the dungeons). I
tested it on an old 1040 without harddisk and played the first 6 or 7
levels with various characters successfully, so anyone should get that
far at least.

E-Mail me if there are problems, comments, flames, etc.

Christoph

Wizard, your life force is running out.

Kevin,
Although somwhat limited, Opus V2.2 does quite a good job at graphing, including pie graphs. I've used it on my TT with excellent results. It's also Shareware, which makes it even better. I know that it's not the best graphing program by far, but if all you need to do is produce a few pie graphs, Opus should be more than enough. You shouldn't have too hard of a time finding a copy of it, as it's a few years old. I know it's on all of the major boards like GEnie and Compu$erve. Hope that helps.
Later...

4590. Questions concerning hard drives, coprocessors, and monitors for the MegaSTE

Newsgroup: comp.sys.atari.st
Date: 1993-03-24 19:26:57 UTC
From: penningt@thorin.cis.udel.edu
Message-ID: <1993Mar24.192657.14417@udel.edu>
Source record: 208426

I have a MegaSTE4 w/ a (small) internal hard drive and I am hoping to "upgrade" it sometime this year. As I was listing the possibilities, a few (probably simple) questions came to mind:

1. Will the controller for the internal drive also support an external hard drive? If so, are there prepackaged kits available (case, power supply, drive mechanism, etc.) that come without a controller.

2. Are there many programs that would take advantage of a math coprocessor? (I'm especially interested in knowing if it will speed up Pagestream). I assume that most all CAD software would check for its existence.

3. Does the new 14" monochrome monitor (from Atari) support resolutions higher than 640x400 with one of the VME graphics cards available? Are there any VME graphics cards available for under $500?

4. Is overscan available for the MegaSTE?

5. Is low res usable on a multisync that doesn't sync down to 15Hz? (e.g., the newer NEC monitors)

Any information or suggestions would be most appreciated.

Thanks,

Gemview (2.20 or whatever the newest versions are) should take advantage of
the Falcon's graphics abilities to display GIFs, JPGs, and other formats.

As for the ST/e, try out Photochrome 3 for GIF viewing...

Wrong. You can use either 1x8 or 1x9. I have 1x9 in my STe, works fine.
So his problem is something else.

It's no rumour about the Atari store in London Ontario...The Digital Centre has an AMAZING selection of ST software for sale. Anything they don't have in stock they can get for you, I think from Toronto. Anyway, just to confirm that this store DOES exist...probably because it also caters to MAC's and IBM types...but these are most definitely secondary to the ST stuff (and will hopefully stay that way).

Source record: 208437

Hi!

Could someone help me out with a problem I am having? I have just
finished the final touches on the first version of a text file viewer
that I would like to post to atari.archive and comp.binaries.atari.st as
soon as possible. I do not know the submission addresses, though, or the
proper format the archive should be in. Should I ZOO it, and the UUEncode
it in one piece? Multiple pieces?

Any help would be appreciated. BTW, the program will be released as
donation-ware. Everything works, but those who send in a donation will
get an optimized version. Does this sound like a good way to release
a program? (Thought I'd throw that in at the end to see what people think
of the idea.)

Any help would be greatly appreciated.

Message-ID: <78194@cup.portal.com>
Source record: 208440

Speaking of the "New" directory at atari.archive, does anyone have a copy of the program "ST-LOGIN"..?

It's been in the New directory for nearly a month, and I've had several requests for it, but haven't been able to FTP it from atari.archive since it's still "new"..

Checking other Atari FTP sites hasn't turned it up anywhere else either.

(Apparently it lets you control an ST remotely...)

If anyone could point me to a different site that has it, or has a copy they could E-Mail me, you could make several Atari owners happy..!

Thanks...

BobR

4601. backup confusion

Newsgroup: comp.sys.atari.st
Date: 1993-03-25 07:16:46 UTC
From: esj@harvee.billerica.ma.us
Message-ID: <H.eg.5abhBc_TZA2@harvee.billerica.ma.us>
Source record: 208202

I am very confused about backup options. I had made up my mind to get
a flopticaI drive for backups. when I called toad to order one, they
said that ther were not selling flopticals because the price was
bouncing around too much and tried to sell me a syquest drive. I then
called purple mountain. they have not returned my calls.

I decieded to reconsider my options. for backup, I can use:

flopticals
syquest
1/4" streamer
floppies
ICD tape

as I see it, the pros and cons of each are as follows:
flopticals
- can't get anyone to sell me one
- may be "fringe" media.
+ convient size
+ can buy supported drivers
+ drive and media can be used on other systems

syquest
- expensive media
- may be "fringe" media.
+ can buy supported drivers
+- can be used as hard drive (but how do you back it up!!)
+ drive and media can be used on other systems

1/4" streamer
- may be obsolete media
+- free driver (lack of support??)
+ possible to read on other systems
+ drive and media can be used on other systems

floppies
- takes forever
- unreliable
+ have drive, media, and backup sw.

ICD tape
- mystery tape
- propritary format
- pricey drive
+ supported (but for how long)

I would like a media/drive combination that has a chance of being useful for
at least 5 years and on multiple platforms (dos, mac, unix or, maybe
even another atari :-)

any ideas?!!!

4606. How to copy ZX tapes to ST disks

Newsgroup: comp.sys.atari.st
Date: 1993-03-25 10:12:15 UTC
From: jens@kssun3.rus.uni-stuttgart.de
Message-ID: <1os0hv$n30@info2.rus.uni-stuttgart.de>
Source record: 208208

On my request for a ZX SPectrum Emulator for Atari ST
I received a great many responses, most of them wanted
to know how I actually copy from tape to disk. So here's
what to do:

(Bad news - I have some hardware that does the trick :-(

I have the Beta Disk Interface (by Technology Research, UK)
for the Spectrum and a 3.5" 2DD Disk Drive.
The disk format is a bit odd
(16 Sectors with 256 bytes on a track) but the Atari can
read it with XBIOS(8) with some tricks.
The BD IF also has a MAGIC BUTTON that saves the whole
48K RAM including processor registers so that I can
copy virtually any program as soon as I have it in RAM,
no matter if it was headerless on tape.

I know about a second way, if you have a MIDI IF for the Spectrum
you can use this method to transfer to the Atari. But as I do not
have such a beast...

Hope this helps. Bye, Jens

4610. Cubase on the Falcon (UK)

Newsgroup: comp.sys.atari.st
Date: 1993-03-25 11:13:30 UTC
From: thumpy@dcs.qmw.ac.uk
Message-ID: <C4Fz6J.6Ho@dcs.qmw.ac.uk>
Source record: 208445

If you're running, or thinking of running, Cubase on a Falcon, I thought you may like to know what I found out last week. I was trying to run Cuabse 3.01 on a 4/65 Falcon on an Atari Mono Monitor. This, it seems, was a *bad idea*. The screen does not update properly, and jumps into "inverse video" after a few minutes running. I 'phoned Harman Audio (UK distributers and support for Steinberg) and here's what I was told:

1) Version 3.01 is only "90%" Falcon-compatible, most of that other 10% being Mono Monitor problems, I guess, 'cos the guy was surprised I could get it to run at all on my set-up.

2) Version 3.02 (received at Harman last Thurs.) is "99%" Falcon-compatible (whatever that may mean).

3) Get a VGA Monitor.

I sent Harman a disk, and received, by return post, a copy of v3.02. It seemed fine to begin with on the Mono Monitor, but still had the "inverse video" prob I mentioned above. Works fine on a VGA monitor in 640x480 with any number of colours, although 2 colour is probably best as it's faster notes can appear in various colours on the Key Editor page. The disk also contained a coulple of .MODules that were not on my 3.01 disks; a Style module and a Chord module. These produce two more track types (Style and Chord) but I haven't really had a chance to play with them so I can't say what they do. A Style track doesn't seem to have Parts, but there's a "StyleTrax" dialog that looks interesting, even if some of the pop-up menus seem to pop up in the wrong place.

While I was on the 'phone to Harman I took the opportunity to enquire about Cubase Audio on the Falcon. No release date yet, but it gave "no problems" at the Frankfurt Music Messe a couple of weeks ago when it was seen to do 8 tracks (count 'em) of 16 bit hard-disk recording seamlessly integrated into the standard Cubase sequencer. Let's see you do THAT on a Mac that costs the same as a Falcon :-) Come to think of it, let's see you do it on ANY Mac without spending more on the DigiDesign boards you'd need than the price of a Falcon...

Try and be a little objective, ATARI DON'T ADVERTISE, its against the instinct

The advert was abviously placed by a third party.

It is that third party that should be geting all the grief.

And if you all want to have a fit of morals there are a few thousand other companies out there that lie through their teeth, not to mention about 90% of politicians, no parties mentioned.

Hi,
yesterday I have been on CeBIT. There were two really impressive things:

1. The GeSoft 32MHz Falcon Card, ot runs on the full TT Speed, has space for
up to 128MByte RAM and a VME Slot!

2. A MPEG decoder from Brainstorm, they have shown some Movies running in Real Time
... faster than the most PC/Mac Stuff!

Unfortunately I had not enough time too look around and thete were lot of interesting
Stuff at Atari like Falcon Speed (a 286 emulator), graphic cards, genlock, Videotitling,
games, DSP Debugger, ...

>and solution?

I haven't had the pleasure of trying it personally, but my friends at
Atari tell me that Version 3.X works quite nicely (it's fine for me
under MTOS on a TT, but that's about as close as I can get to a
Falcon). Make sure your friend has version 3.X rather than 2 - get
the upgrade from Gribnif if necessary. Also, don't forget to select
the TT/MSTe ports in the port dialog since the Falcon just has the SCC
chip and doesn't have the 68901 found in other STs.

Hearing all these things about write and read caches makes it
difficult :). What caches do only read caching? Is TCache such? Using
my (very) poor German skills, I tried to read the TCache documentation
(The part in the beginning with somekind of a warning), and I think
they said something about data loss? CACHENN by atari is a read only,
isn't it?

And here's some good news...

I made a programme for an 8MHz ST to load ZX tapes through any pin of the
printer port... I'll see if I can get the source up on the net tomorrow.
All you have to do is to connect you favourite ZX cassette recorder to
the printer port... and voila... loading...

Has anyone out there gotten the Jan/Feb issue of AtariUser yet?
It has yet to show up at my door.

Unfortunately, this is not a first for me. I never received the
May or Sept issues either. In June, I wrote AtariUser a letter.
Nothing. In October, I tried sending them e-mail from the internet.
It didn't bounce, so I assume they got it. Still nothing.

Needless to say, I'm starting to get a wee bit annoyed.

Can anyone suggest another recourse? I see John Nagy's name on Z-net.
Does he read news? Anyone got his e-mail address?

Any help would be appreciated.

From the Holy Book of <H.eg.5abhBc_TZA2@harvee.billerica.ma.us>
as spake by esj@harvee.billerica.ma.us :
>[asks for advice on backup systems]

This is eerie. I was just about to ask a very similar question. As a rider to Eric's question, I'd like to add a question of relative price [we poor starving grad students have to be careful with our money, after all ;)].

Also, as a side question:

> 1/4" streamer
> [...]
> +- free driver (lack of support??)

I assume this refers to TapeBIOS (if not, ignore the quote). Does anyone have experience with TapeBIOS? What software supports it? (I know, for instance, that some versions of Gnu tar support it -- does the latest version, 1.11.1?) Can I expect to be able to buy an off-the-shelf tape drive, plug it into the SCSI port on the back of my external hard drive, crank up the software and have it work the first time?

4631. One way to transfer to/from ST/Mac via Spectre (non-GCR)

Newsgroup: comp.sys.atari.st
Date: 1993-03-25 23:40:59 UTC
From: ggreenbe@rodan.acs.syr.EDU
Message-ID: <1993Mar25.184100.22439@newstand.syr.edu>
Source record: 208220

Someone asked about this kind of thing a while back, and while I replied to him personally, I've hit upon a new method of getting files back and forth between ST and Mac while running Spectre (non-GCR). It involves using AccessPC by Insignia, which allows a Mac to read msdos-formatted disks. If all you want to do is transfer text/ascii files, that is all you need...but if you want to transfer executables/programs or formatted text files, this will not work (at least not for me...or not always). There is an easy way around this, though...all you have to do is binhex the file. This makes the file into a text file that can be traded back and forth between platforms. These files have .hqx extensions. This is really nice, since most (if not all) Mac ftp sites usually keep their files in this format. So, you can get all the files you want via ftp using your ST, then transfer them to your Mac/Spectre that is running Access PC. (I guess this will work with SpectreGCR as well, now that I think about it.)

Well, this may have indeed been spelled out somewhere before, but since I haven't seen it in a while, I just thought I'd throw it out for whomever might need it.

>decompression routine), but what it's saying is that if you had a monitor that
>had a frame rate of 200 fps, the Amiga would be able to animate at that speed.

You are entirely missing the point. No matter whether the CPU or the display list processor is fetching the video memory, *some* processor *somewhere* on the system bus has to pull bytes from RAM and send them to the video DACs or whatever hardware is used to generate pixels. Whatever that device is, it needs to send 256kbytes of data to paint a single frame. If you are saying that the Amiga's chip-RAM bus bandwidth is in excess of 51.2Mbytes per second, fine. But we're not talking about loss of CPU time here, simply the mechanics of moving bits from RAM to pixels. For some reason, I doubt that the bus actually supports a bandwidth of 50 or so megabytes per second, but if you can prove that it's so, fine.

4635. Re: TT's VGA monitor

Newsgroup: comp.sys.atari.st
Date: 1993-03-26 00:24:00 UTC
From: Peter_Missel@k.maus.de
Message-ID: <A14409@K.maus.de>
Source record: 208222

s>I believe is says (TT - VGA). I also have a 386SX-33. My question is what
s>kind of board would I need to hook up my TT monitor to the 386? Is it just
s>a plan VGA board? Does anyone make a "Monitor Master" that I could switch
s>back and forth between the 386 & the TT?

All you need is a plain VGA board.

The switch on the monitor's back just flips display width.

>O.K. Intel just hosted a conference about its Pentium Chip
>here at the University of Mihcigan Ann Arbor a few days ago.
>They are going to introduce the Pentium by next week (May 25th).

Ah, I guess that means there'll be another 3 classes of UM Engin grads entering the world with useless microprocessor info filling their heads. How nice. (Intel has donated lab equipment to various colleges. When I was at UofM they had just discontinued the silly 8086-based "computer architecture class" which was really just a "memorize 8086 assembler mnemonics" course...)

>They also explained about the technical details about the chip.
>In short, if one of you had been to the talk, I think you
>would reconsider posting such a ridiculous theory.

Anyone can talk about the features of what they're *going* to show you...

>Here is the real scenario:

Surely, as an experienced Amiga or Atari newgroup reader, you would have learned by now that "the real scenario" is only the one where the subject machine has actually appeared in mass distribution...
>
>Pentium and Alpha chips are going to RULE the 90's.

Alphas are certainly very nice processors. DEC would certainly like you to believe that they will rule the next decade of computing, but that's probably at least a little bit influenced by DEC's continuing loss of market share on their VAX architecture, and that they've bet the farm on Alpha. Just because the Alpha has a very nice architecture doesn't mean it will succeed though; it will certainly not be the *only* nice 64-bit architecture on the scene. (ref the PowerPC line, IBM's joint agreement with Motorola to produce their new RISC chip. I think Intel is really going to be out in the cold, and deservedly so. It's a good bet the "IBM PC" of the future will not be Intel based.)

>Hard performance numbers/installed user base and
>professional magazines will confirm this.
>The Mac is going to be there with Totally different OS.
>Unix is going to be more specialized machines.

I didn't understand that paragraph at all. Care to elaborate?

Surely you're not surprised? When did Atari ever stick by their early
announcements?
Mind you, I do love my MegaSte - even as much as my now departed old 1040St!
How can anyone who bought their machine within the last 2 years afford to
get a Falcon?

No: DD compresses/decompresses data files individually, not whole partitions.
You can control which files can be dieted, by configuring DD.
Yo have a working directory set aside on your HD. I'm not sure if you can do
it without an HD - maybe you can use RAM - I dunno: never had to do so!
I had Vn1, now have Vn 2: they have never crashed me yet!
Saves a lot of disk space!

You are not alone. I subscribe to AtariUser, Atari Advantage and Atari Interface. I have not received a single issue from any of these magazines since the start of the new year. Did all three decide to fold up at the same time?

I must admit I'm beginning to think that I own an orphan computer. And seeing various magazines for Mac and Amiga alongside Time and Newsweek at any news stand does not help either.

4640. Re: specifies ram program

Newsgroup: comp.sys.atari.st

Source record: 208233

] I need the name of a program that explains to my ST that I have 2.5 megs
] ram rather than 4.
] I also need to know where I can download this program from.

This is at the top of the doc's for 'MEMSET.PRG'

Program title: Memory set
Program version: 3.20

It *should* be available on atari.archive.umich.edu in the atari/Utilities/
directory, under the filename memset.??? (where ??? is arc/zip/lzh or zoo)

Since the file is quite small, I could encode it & put it up on
comp.binaries.atari.st!

(The executable is under 1k, and the doc's are under 5k...)

AtariUser has run into a streak of bad luck lately, but is expected to return soon. I don't have all the details, but apparently some of it involves an auto accident with publisher John Nagy, which resulted in not enough money needed to print the latest issues. The folks are working to get back on their feet, though; they are taking advantage of the current hiatus to collect some of the money that advertisers owe them.

AtariUser gets hit hardest because it is a free magazine. They recently had to stop taking subscriptions because each one was a lsos. Again, I don't have all the details, but the bottom line is that AU will be back pretty soon.

4647. falcon prices in Sweden?

Newsgroup: comp.sys.atari.st
Date: 1993-03-26 08:57:12 UTC
From: watchman@ludd.luth.se
Message-ID: <1993Mar26.085712.2940@ludd.luth.se>
Source record: 208236

I was recently told by a friend (and Amiga owner) in a very amuzing way that the falcon 030 is supposed to be sold at around 16000 SEK for the 4Mb+65Mb HD version. Is this right (i.e. have any Swedes seen any official prices?)

I guess this ain't the most exciting news for non-swedes so mabye you should mail me the replies.

4648. ** MasterBrowse 1.0 RELEASED (comp.binaries.atari.st)

Newsgroup: comp.sys.atari.st
Date: 1993-03-26 09:26:10 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.D35EihV2k7A@elfhaven.ersys.edmonton.ab.ca>
Source record: 208253

Hi!

MasterBrowse 1.0 has now been sent to comp.binaries.atari.st, so it should hopefully appear soon. What is MasterBrowse? Here is an excerpt from the documentation:

Everyone who owns a computer has, at one time or another, needed to view the contents of a text file. The text file viewer supplied with Atari computers will allow you to do this, but it is lacking in many respects.

MasterBrowse is a replacement text file viewer for any Atari computer, in any resolution. It offers many features that the Atari text file viewer does not:

* MasterBrowse has a very fast GEM user interface, with special features such as flying dialogs and raster-copy redraws. Of course, all functions in MasterBrowse can be accessed through the keyboard as well as the mouse.

* MasterBrowse allows you to have a virtually unlimited number of documents open at the same time, restrcited only by the number of free window handles and the ammount of memory available.

* MasterBrowse can use the command line (of course) to get a list of documents to load. The ARGV, xArg, and standard command line formats are supported.

* MasterBrowse allows you to move in any direction inside a document:

-Top Of Document, Bottom Of Document
-Page Up, Page Down, Page Left, Page Right
-Line Up, Line Down
-Character Left, Character Right
-Extreme Left Window Page, Extreme Right Window Page

Do you still want more? Keep reading.

-You can jump to a specific line, a specific page, or any of ten "bookmarks" that MasterBrowse supplies for your personal use.

* MasterBrowse also offers you the ability to search for a string inside a document (case sensitive or case insensitive). After the string is found, another command may be used to find the

next occurence of the string.

* MasterBrowse also has block functions. You can mark a block off, and then save it to disk or print it. More details on the extensive printing features offered by MasterBrowse can be found below.

* Printing? MasterBrowse is a master printer. It can print a document (or a block) with page headings, page numbers, line numbers, or a combination of the three. It can even print an identification string for those people who share a printer between more than one computer.

* MasterBrowse even has a (very) simple online help system.

Enjoy!

-Michel Forget
Electric Storm Software
March 25th, 1993

MasterBrowse 1.0 is Donation-Ware. All of the features work, and nothing has been restricted. If you like/use the program, a donation would be appreciated.

>official prices?)

>I guess this ain't the most exciting news for non-swedes so mabye you
>should mail me the replies.

Well it might be interesting for others to hear how the Falcon
is marketed in Sweden (Scandinavia):
Yes, I have been told almost the same: 16000 - 17000 SEK.
This is approx 2300 dollars (!). It should be stated that in Sweden
you can buy 2 (two, yes i wrote 2) Macintosh Color Classic with 030
processor and harddisc *and* color monitor for the same price. Well
you might say that you shouldn't compare with the Mac, that the Mac
doesn't have a dsp etc. Thats right but note that here in Sweden
Apple have big marketshares especially in the universities and they
have gigantic advertising campaigns. How in their wildest fantasy can
they imagine to sell the Falcon030 with this price and this competition
with for example Apple Macintosh ?
The answer to this ridiciously high pricing was "Well, the machine is
a beast so it should have this price". By using this kind of pricing
in Sweden together with a very little and non-advertising general-agent
the Falcon030 will definitely be a loser here in Sweden. Once upon a
time a had a hope for Atari. I am a satisfied ST owner who uses my
Atari for making music. Now I'm beginning to get tired of this company.
How can they let such things as this happen.
The price is to high. Read my lips: TOO HIGH!!!
If Atari don't make some sense out of the price-setting of this
crazy general-agent here in Sweden. No one will buy it. It's that
simple. I havent seen *any* ads at all in Sweden for it and the marketing
is done by a company I never have heard the name of (and already have
forgotten). Thats it! It's bad news, but it's reality.

Do you by any chance have a description of the format of these 48K processor dumps? A while ago someone at Reading University found a huge supply of Spectrum games (I have no idea who or where they came from) which were all in the form of a 49179 byte dump file. I assume that 49152 of this is the memory dump, and the 27 other are the registers.... but which are which I have no idea, so I couldn't include them in my Spectrum emulator and run 'em.

Andrew.

You can do that yourself quite easyly! Just set the Phystop Variable in the Systemvariables to the required value and reset your computer!
You can set Phystop for example with the GFA-Basic command SLPOKE!
I do not have the memory-address of phystop at hand now. If you need it, I can look it up for you, if you want. (I could even write you a small program!)

Date: 1993-03-26 11:57:02 UTC
From: bundy@informatik.uni-rostock.de
Message-ID: <C4Hvv2.DID@informatik.uni-rostock.de>
Source record: 208249

I look for the functional programming language HOPE for the atari ST.
Who can (would) help me? Who knows a archive where I can get it?
Please, send mail to bundy@informatik.uni-rostock.de.
Thanx!

4654. Re: Installing GCC on an Atari ST

Newsgroup: comp.sys.atari.st
Date: 1993-03-26 12:34:19 UTC
From: jam@uni-paderborn.de
Message-ID: <1out8b$p84@news.uni-paderborn.de>
Source record: 208243

Hello and hy,

I installed the gnu-cc (Vers. 2.3.1) on my STFm. My computer's configuration
looks similar to that described below. So here are (hopefully) some hints:

Richard A. O'Keefe (ok@goanna.cs.rmit.oz.au) wrote:
: One of my students has an Atari 1024ST with 4Mb of memory and a 105Mb
: hard drive. He recently FTPed the Atari port of GCC from somewhere in
: Germany, but he cannot find any installation instructions.
: Specifically:

I got the binaries aof gnu-cc from the ftp-site at uni-paderborn.de
(131.234.2.32). Connect via naonymous-ftp to it and then change to
atari/gnu. There's a file named ''installing'' with a lot of hints
to install gcc with various oportunities to install further helpfull
gnu-software (e.g. gnu-make). You can also refer to the atari/gnu/doc
-''section'' where are some TeX-Files describing how to work with
the gnu-c-compiler.

: - which files does he need on his hard disk when he starts installing?
: - which files can he he discard when installation is finished?
: - what does he actually do to install GCC?
: - how does he use it once it is installed.

: Presumably this information is already written down somewhere, so just
: point to me a site that has it.

: I'm sorry, but I don't read either of these newsgroups (it's as much as
: I can do to track comp.std.*, comp.lang.various, and comp.risks), so
: could you please E-mail the information to
: ok@yallara.cs.rmit.oz.au

--
Hope it will help you , yours, Jan.

4657. Colors on Falcon

Newsgroup: comp.sys.atari.st
Date: 1993-03-26 12:50:41 UTC
From: grosland@taliesin.greco-prog.fr
Message-ID: <1993Mar26.125041.28201@greco-prog.fr>
Source record: 208261

Hi everybody,

I just want to ask you a small question about the palette on FALCON.
Where is the address of the beginning of the 256-colors palette ?
Is there an address or is it as on PC's VGA's card : by port (&3C8h).

By the way, it is maybe time to make a FALCON newsgroup ! NO ?

S. G.

4658. End of term.....a summary....

Newsgroup: comp.sys.atari.st
Date: 1993-03-26 13:36:08 UTC
From: Craig.Graham@newcastle.ac.uk
Message-ID: <C4I0G8.GF3@newcastle.ac.uk>
Source record: 208225

And so another college term draws to a close.....a term in which I got my Falcon and watched it break down by parts. In which I got multiTOS and found it was to slow to use (passing note : GalaxyCAD, the electronic design package from Uni. Wisconsin is the first program I have found which ONLY runs on a Falcon if you ARE running MultiTOS (it works fine on an ST without ????)). A term in which I got FSM GDOS, and found it doesn't work on a Falcon. A term in which I now find my Falcon is already obsolete as Atari replace it with the TT cased production model.

All in all, a bit of a bugger really.....

.....Bye Bye for Easter, back on line in a month.

Craig.

Look for Ian's "Heat and Serve C" compiler. GEMENV is part of his
Sozobon C release. I believe HSC140.LZH is the latest version and you
get a fairly good public domain C compiler as a bonus. :)

Source record: 208246

Hi.

Someone could transfer my ZX-Spectrum games to Disk ???

I give you my girl-friend and half the kingdom... :-)

Well at least I have a ZX81 Emulator and an Specci Emulator running
on my TT. The ZX81 is far too fast for doing any games. The Specci
Emulator is 1:1 speed.

But I need games for it !!!

VALHALLA,Knight Lore,Underwurlde etc. PLEASE HEEEEEEELP !!!

Ciao

ekrimen@netcom.com (Ed Krimen) writes:

>Sounds great. What's a mailbox system? Like a BBS?

It IS great. There are lots of Mailbox Systems here in germany...

Madness,Maus,BBS and some others too.

This is a NEW System. We called it SUPRIMA. It's especially thought
for Sysops who do not want to have an own computer for doing mailbox-
work.

Now SUPRIMA can even receive FAX !! It distinguishes between FAX and
Data call. Of course you need a FAX-Modem for this feature. But for
Mailbox-Functions you can have a modem of your choice. SUPRIMA works
with ALL modems, on ALL ATARI-platforms, in ALL resolutions.
You only need 1MB RAM and you should have a HD-drive.

Ciao
Atarico

4663. 2nd CFV and VOTE ACK: comp.sys.atari.advocacy

Newsgroup: comp.sys.atari.st
Date: 1993-03-26 16:04:32 UTC
From: dxo@cs.bham.ac.uk
Message-ID: <1ov9igINNafn@rodan.UU.NET>
Source record: 208248
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st,comp.sys.atari.st.tech

```
SECOND CALL FOR VOTES and MASS VOTE ACKNOWLEDGE
===============================================

This vote has been running for two weeks.

This is a Call for votes on the creation of a newsgroup for
debates about the Atari range of personal computers.

Group Name
==========
comp.sys.atari.advocacy

Status
======
Unmoderated

Charter
=======
This group is a forum for discussion of topics in connection with the Atari
range of computers - marketing, capabilities, comparisons and other
arguments... It will move discussions of this nature from the existing
comp.sys.atari.st (and atari.8-bit) newsgroups, which will exist for a more
advice orientated discussions.

Users will be requested to not post the above discussions in the existing
newsgroups if advocacy is formed.

Users will be requested not to cross post disscussions in other advocacy groups
to this one.

Rationale
=========
This group will separate a section of discussion, mainly from the current
newsgroup comp.sys.atari.st but also relatted topics including the Atari 8-bit
range of computers (atari.8bit) and the new Atari Falcon computers.

The discussion of advocacy currently takes up over 50% of the items
in the atari.st newsgroup and so it is felt that the original
purpose of the newsgroup is being left behind.

New users and people who need information about the Atari ST/8-bit computers
can continue to use the original group and would hopefully get more
attention if there is less advocacy mail present.

Voting
======
VOTING PERIOD IS:
```

appearance of this message
to 1st April at 9:00 GMT.

HOW TO VOTE:
1. REPLY to THIS message.

2. send your votes to:

dxo@cs.bham.ac.uk

3. if that doesn't work, try:

dxo%cs.bham.ac.uk@nsf.ac.uk

WHAT YOUR MAIL MESSAGE SHOULD CONTAIN:

For a yes vote:

I vote "Yes" for the creation of "comp.sys.atari.advocacy"
VOTE: lastname, firstname [email address] : YES

For a no vote:

I vote "No" for the creation of "comp.sys.atari.advocacy"
VOTE: lastname, firstname [email address] : NO

Your message must be of THIS form, especially the second line since
my vote counting software needs bothe the 'VOTE:' and the ': YES/NO'.
Remember to replace the lastname forename and email address with YOUR
name etc!!!

Rules on voting
==========

Voting Rules:
-Only one vote per user (Two different people cannot vote under the
same user name).
-Any votes which are received before or after the voting period
will be discarded.
-Any vote which does follow the above examples specifically,
will not be valid.
-Anyone who wants to change their previous vote may do so by voting
again. They must indicate that they have previously voted and are
changing their mind in a footnote. A changed vote will discard your
previous vote.

Ambiguous Votes:
Ambiguous votes -- those who do not follow the specified format, or
do not make clear the voter's intent, will, where possible, be
returned to their senders for clarification. Ambiguous votes which
cannot be returned to their senders or for which no clarification is
provided will be identified in vote mass acknowledgements and in the
final vote tally.

******* ANY PROBLEMS, MAIL THE ADDRESSES ABOVE! *********

Thanks to Danny Richman for the basis of this CFV!!!!!

Proposers
=========
David Oakley dxo@cs.bham.ac.uk
Ian M Rae imr@cs.bham.ac.uk

4664. Wanted: Pirates & Quadralien

Newsgroup: comp.sys.atari.st
Date: 1993-03-26 17:18:59 UTC
From: Devon_Sheppard@mindlink.bc.ca
Message-ID: <22530@mindlink.bc.ca>
Source record: 208250

I've been looking for to buy Pirates! for the ST for a while, but it seems that it's no longer available. I'm having the same problem with a game called Quadralien, which I foolishly lent out a few years back and never saw again.

If someone has an original of either game that they would like to part with, please leave me some email, as I do not read this group regularly.

I also have a few games to get rid of, so leave me mail if you're interested in a trade.

Devon

From: NWZ90G@cheltenham-he.ac.uk
Message-ID: <9303261807.ag17748@demon.demon.co.uk>
Source record: 208256

Hello all,

I am a computing student at the Cheltenham & Gloucester College of Higher Education, England. I am currently involved in a software usability project, and to complete this project I need some help!

I need to get your views on the usability of software, and to this end I have produced a questionnaire which if anyone could complete I would be very grateful. If anyone feels they can help, could you please mail me and I will then send you an electronic copy of the questionnaire.

I will mail you the results of the survey, if anyone is interested.

Thank you in advance,

Jeremy Curtis (nwz90g@chelt.ac.uk)

4667. Wanted: Software for small business

Newsgroup: comp.sys.atari.st
Date: 1993-03-26 19:03:13 UTC
From: belaire@bcarh901.bnr.ca
Message-ID: <1993Mar26.190313.11776@bmerh85.bnr.ca>
Source record: 208255

Are there any good programs for the ST that can track
inventory, prepare invoices, prepare orders, keep price
and cost lists, and so one, and are easy to use?

Public domain, shareware or purchased software are
all fine with me.

Thanks

Ron Belaire (belaire@bnr.ca)

4668. Overscan For Mega 'E

>
Computability advertises internal flopiticals for $309, and
better business systems for $299. Both always advertise in computer
shopper, and the former has really good prices on quantums. I haven't
called and aksed either about availability, I just think its a big
mistake to get non-atari stuff from atari mailorder houses.

> + drive and media can be used on other systems

I was just considering backups myself. I don't know much
about tapes, but this is what I think I know: QIC-40 tapes such as
the Jumbo 120 are cheap and undustry standard. They connect to a
floppy controler. On an atari, this means transfer is limited to
150kb/sec. SCSI tape drives for macs are not QIC-40 compatible and
cost nearly $500. In reading this newsgroup, I have developed the
impression that many cool SCSI peripherals were availble for Macs
really cheap. This is not true: scsi 1.44m floppies > $200 (I assume
they are scsi, otherwise why would they cost so much.) scsi ethernet
> $300. If anyone else was deluded like me, now you know.

>

Sure. But How?? AND - this is NOT, I repeat NOT updating desktop stuff.. Just
showing a static image. You could never use Photochrome's technique to update
a full desktop screen without getting lots of flicker, turning the screen
off for awhile, or something. It would not be 'smooth'...

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

To *anyone* interested in overscan....

The Overscan available on atari.archive.umich.edu (and elsewhere, including commercially), will NOT work on any machines above the STFM!
(Or Mega-ST).

It will not (apparently) work on TOS versions newer, or older, than 1.2 (1.02), or 1.4 (1.04).

If you have an STE, Mega-STE, TT, Falcon, you can forget about this overscan. (The Falcon has overscan, so you don't really need it anyway).

4675. Higher Resolutions on Falcon

Newsgroup: comp.sys.atari.st
Date: 1993-03-27 00:49:47 UTC
From: glennd@pioneer.arc.nasa.gov
Message-ID: <1993Mar27.004947.22866@news.arc.nasa.gov>
Source record: 208264

Several posts have mentioned the ability to generate higher resolutions just in software (e.g. 800x768 or 800x600). Is there any way or place to access this software? This sure would make the Falcon more attractive to me. Can the "super_78" program (sets SVGA screen to 78Hz scan rate) be used for changing resolutions?

Thanks.

- Glenn

4676. Falcon As MIDI Sampler?

Newsgroup: comp.sys.atari.st
Date: 1993-03-27 00:58:51 UTC
From: glennd@pioneer.arc.nasa.gov
Message-ID: <1993Mar27.005851.23125@news.arc.nasa.gov>
Source record: 208265

Is there any way at present to use the Falcon as one would a
traditional sampler in a MIDI context? I know you can sample sounds
and save to disk, but what about playing notes on the Falcon using
MIDI note-on commands? Right now, I'm not as interested as triggering
an entire audio track as having the Falcon respond to MIDI commands,
like note-on, velocity, and ideally other MIDI continuous controllers like
volume, etc. Is there any software present or planned, that will
allow the Falcon to be used in this manner?

Also, when playing back the digital audio tracks, the only way to get
the audio from it (without some expensive hardware addon unit?) is
through its builtin stereo out port, correct? I've read that since
this is "bass-boosted", its not suitable for "pro" recording
applications. Is this really an issue? Couldn't it be treated with
outboard EQ if it were too boomy?

Thanks for any illumination on this subject.

- Glenn

4677. Beware of cker5a.zoo -- File sizes do not match!

Newsgroup: comp.sys.atari.st
Date: 1993-03-27 02:29:54 UTC
From: moorebj@verdin.icd.ab.com
Message-ID: <1993Mar27.022954.21666@icd.ab.com>
Source record: 208266

I have recently become aware that version 5A(188) of C-Kermit for the ST has been uploaded to atari.archive. A spot check of the binaries shows that the file sizes are *not* correct. The correct file sizes are 277937 for the version with the command parser, and 81693 for the version without the command parser.

I will upload a known good version in the next few days. In the meantime, this version should be viewed with suspicion.

*** stuff deleted ***

I want to add that the price in Norway for the same configuration is
aprox. 14.000.- NOK (2000$). You can't blame Atari for the 300$ difference
of Norway VS. Sweden.

Now, let's look at the taxes we have to pay on a computer: The VAT is 22%
here in Norway and there is a customs fee of 4% on top of that, making the
net-price (without taxes) 1580$ which still is quite high compared to German
prices! A dealer here told me that he would not start selling Falcons before
he could sell them (with reasonable margins) for 10.000.- NOK (1430$) for
the 4/65MB configuration. That is actually a 30% price cut. I have a strong
feeling that this is likely to happen within 6 months!

Of course your comparison with the mac is still valid, because they also
have to pay the same taxes. But the price difference is not 2:1 here. More like
1.5:1 !

Enough rageing about the price. I have to give Atari a tiny bit of credit
because thay've managed to sell at this high prices. You can't deny that
all machines made available for the public are beeing riped off the shelves
faster than Atari can supply them:-)

Since I am the person who put cker5a.zoo on a.a. (at the request of another Usenet reader), I was curious about this and just downloaded the file from a.a. and unzoo'd it. I find the file size of the main executable to be 278,016, i.e. 79 bytes larger than Bruce Moore says it should be. The executable worked fine, by the way. I don't know what accounts for the difference - it is possible that I may have packed the executable for use on my own system for a while (I don't use it any more) and then have unpacked before zoo'ing up the archive for u/l to a.a. Perhaps this could have caused a few bytes discrepancy?

The other, smaller binary, in my archive is 81,920, a 227 byte discrepancy compared with Bruce Moore's figure.

John

If you want to stay with an Atari, I'd recommend buying a new system, rather
than upgrading your aged 520ST. There are some fine buys available right now
for MegaSTe systems and it really is a nice machine, and superior to the
Falcon in many respects (IMHO).

Of course, if you decide to change platforms, that's another story...

4689. XYZ problems with Serialfix 2.0

Newsgroup: comp.sys.atari.st
Date: 1993-03-27 20:31:59 UTC
From: paetau@mits.mdata.fi
Message-ID: <1993Mar27.203159.22277@prime.mdata.fi>
Source record: 208277

I've been experiencing problems when I use XYZ and Serialfix. It occurs even on version 1.? of serialfix. The problem is that every time I upload something with XYZ's Z-Modem, it will first transfer the file but after it is ready it will not exit, but it starts waiting for something, and then I think it tries to tell me that the receiver didn't acknowledge the end of the transfer. If I use any other RTS/CTS patch I don't have this problem, but I'd like to use Serialfix as I understand it is above the others :).

4691. Getting RAM software

Newsgroup: comp.sys.atari.st
Date: 1993-03-27 22:55:39 UTC
From: pb6755@csc.albany.edu
Message-ID: <PB6755.93Mar27225539@thor.albany.edu>
Source record: 208284

I am the owner of an Atari 520ST with little experience on the Net. I want to obtain software for RAM, and although I understand it is available at the UMich. archive, I'm not certain how to go about it. When a friend of mine tried to retrieve Uniterm software from there, we could not get it to work. (Finally, a fellow Atari owner was kind enough to snail-mail us a Uniterm disk.) I'm not a computer whiz, so I can't explain what went wrong, but my friend said the software arrived in pieces that then had to be reassembled, and it was in the reassembling that things got bollixed up. Could someone explain the steps that must be taken to reassemble the RAM software? In particular, my friend says he needs to know about UUE codes.

Thanks for your help.

Phil Brown aka pb6755@csc.albany.edu

>> PC. I
b>
b> Say What????? Time is runnign out for PCs? Where did that idea come
b> from? I mean the fragmented market and everything probably has some
truth
b> in it, but PCs dying? *NOT*.

Well, you'd be surprised really. As an example : A certain paternal relative of mine is the IS manager for a large national retail chain (over AUD$1bn turnover) ... They have recently scrapped virtually every PC they use, due primarily to the exceptionally poor reliability of Windows and associated software (particularly Lots 1-2-1 and WordDefect) and replaced them all with dual-486 based Siemens SCO-MPX systems.

A large number of major organisations here in this little hick town on the edge of nowhere are scrapping their PC fileservers and swapping to unix systems like the SS10...

Our national telecommunications carrier no longer purchases, or uses, PC systems for _any_ major CAD work.

b> O.K. Intel just hosted a conference about its Pentium Chip
b> here at the University of Mihcigan Ann Arbor a few days ago.
b> They are going to introduce the Pentium by next week (May 25th).
b> They also explained about the technical details about the chip.
b> In short, if one of you had been to the talk, I think you
b> would reconsider posting such a ridiculous theory.

I doubt it. After a little while all the hype just bores me - very little is ever said at 'lectures' like that. It's not until you have the databook in hand, and a smoking prototype on the bench that you know how badly they screwed it up.

b> Here is the real scenario:
b>
b> Pentium and Alpha chips are going to RULE the 90's.

I find that incredibly funny 8)

b> Hard performance numbers/installed user base and
b> professional magazines will confirm this.

Hmm. I like that. Not 'ease of integration' or 'advanced programming features'... but 'professional magazines' will ensure these new designs rule the '90s. Hmm. Let me guess : this 'lecture' was conducted in American?

b> The Mac is going to be there with Totally different OS.

Hmm. So no software? sure to sell well.

b> Unix is going to be more specialized machines.

laughs uproariously (and not at your grammar which is atrocious). Unix in various flavours will quite possibly be the deciding factor...

b> I would be really surprized if AMIGAs were still
b> around, say 1996. (Well, I have to admit that this is also too
b> far fetched.)

They'll be there. Look how long the CoCo has been around...

b> Anyway, I have enough techincal details of both Pentium and
b> Alpha chips from reliable sources to support my theory.
b> (I have two friends takling a microprocessor design course
b> at the U. of M. They are mainly studying the Alphs AXP
b> architecture among others)

Yup sure. If technical merit had much to do with it, the designers of the PC would have been shoved head-first into a wafer oven.

b> I realize that all AMIGA owners wish that the AMIGAs become
b> a major PC platform. But the idea of PCs dying is just a
b> wishfull thinking, IMHO.

The PC architecture has hit a hard performance limit, and it's time for them to go. It won't be a rapid departure by any means, but the writing is on the wall, no matter how faint it may seem to you.

j>
j> IF LIES ARE THE ONLY WAYS OF SELLING YOUR MACHINE... THEN MAYBE YOU
j> OUGHT TO GO BACK TO MAKING CALCULATORS. I THINK CONSUMERS DESERVE MORE
j> THAN THIS OUTRIGHT BULLSHIT
j>]

I think you need to cool off more than just a tad and learn a little about
how ignorant people are, and how advertisers live off the fat of the
guillible.

I've been accused of cheerleading, but that ad pissed me off to the max, for
obvious reasons.

Atari OZ' only reaction to the ad, that I know of, was to cringe. Tandy
showed it to the other atari dealers beforehand, who uniformly reacted with
'you have to be joking' style replies - a pity they weren't.

Stop subscriptions! Stop subscriptions! They can't do that! No local
dealers here carry AtariUser (perhaps this is part of their problem).
Personally, I'd even be willing to pay more to get it delivered.

If they're having trouble getting money from distributors, perhaps it's
time to give up on the "free" idea. Granted, it's a noble notion, but
the extra cash flow might be just what they need. Just MHO.

[> --

TCache can do both. If you are paranoid, or have some reason to expect
power failures, then you can disable the write cacheing. I believe it is
the third option in the Install menu, but you can check for sure by reading
the english doscumentation (short, but useful) that comes with TCache 6.0.

I hope this helps you out.

4703. The Game of Life v4.1 new at atari.archive...

Newsgroup: comp.sys.atari.st
Date: 1993-03-28 16:17:44 UTC
From: jeroen@let.ruu.nl
Message-ID: <1993Mar28.161744.27336@let.ruu.nl>
Source record: 208291

Hi there!

I've just uploaded the final version (...) of ST Life to
atari.archive.umich.edu.

The new version differs from the previous ones in a number of
ways:

* Enhanced user interface (flying dialogs etc. etc.);
* On-line help is available.

For those who are new to the program and wonder what it is: ST Life is
a generalized cellular-automata examination tool, that even if used as
a simple 'life' variant has various nifty features not found in other
implementations.

For questions read the docs or the on-line help; if that doesn't help
mail me <Jeroen.Scheerder@let.ruu.nl>.

KF> Overscan just dead past TOS 1.4? thanx.

As far as I know Overscan isn't available for STE's. It has nothing to do
with the TOS but with the way the STE handles the screen output (or
something in that direction...).

Very true. I'm wondering if anyone knows why it's so cheap ? Two reasons
I could see: they're not selling, or the Falcon is going to appear soon.
A friend of mine bought an Ste in January this year, and he had to
wait a month for his monitor, reportedly because the Atari's were selling
much better than expected, and Atari didn't have enough monitors to meet
demand.

Gemini is a VERY big desktop replacement, not much use on a 1meg system!
Although it has plenty of features!
DC-Desktop is a bit lacking on features compared to Gemini, but is a
lot smaller!

The best I've seen is 'Teradesk', as many, if not more features than
Gemini, all-loaded, uses only 120K of RAM, and roughly the same amount
of disk-space!

Great program, which uses TOS 2.xx and higher DESKTOP.RSC files for the
icons, so you can swipe those (it comes with the basics).

DC-Desktop should be in the /Dc section on a.a. (If it's PD that is,
I can't remember, the version I had was probably the demo)
The latest (last) version of Gemini is available somewhere on
atari.archive.umich.edu (probably in the Utilities/Desktop section)
Teradesk should be on there as well, if not, I'm sure someone else
knows where it is!

Hello world,

Sorry to cause any trouble. I noticed the file sizes did not
match and immediately assumed the worst. Actually, the version currently
at atari.archive matches up to EOF, some piece of software padded to the
next 512 byte boundary. Mea culpa.

BTW, I have uploaded the original binaries (as penance ;-) having
the "correct" sizes.

>up to 128MByte RAM and a VME Slot!

Wasn't that just 32MB of RAM? BTW, they haven't implemented the VME yet. (I thought the chip looked like a 50MHz thingie from the reading of the print on it...)

>2. A MPEG decoder from Brainstorm, they have shown some Movies running in Real Time
>... faster than the most PC/Mac Stuff!

Well, I saw the thing and thought it sucked. They haven't laid too much work in it yet since they don't know if Atari buys it or not...

>Unfortunately I had not enough time too look around and thete were lot of interesting
>Stuff at Atari like Falcon Speed (a 286 emulator), graphic cards, genlock, Videotitling,
>games, DSP Debugger, ...

Some great things were on show. The InShape renderer (really great looking interface), Lexcor had their stuff there (good, but needs a new interface), PAM's net might be good, but the guys need a new attitude ("we won't make a LAN network because you have to go to a Mac dealer to get cables..."), the BlackMail box from DOA was shown and looked really good, Chagall was impressive but needs more features, Matrix showed their new video/digitizer card (8MB VRAM, 8MB DRAM + 1 Meg on the digitizer!! DM 8K though...), DA's Vector was _REALLY_ impressing, as was the PhotoCD software from ColorConcepts. I've been hearing complaints about getting the base16 (3Kx2K pixels) onto screen in the cd newsgroup, but this baby did it on a 32MB TT in 4 mins! Looking good...

Now, I'm just looking forward to Dusseldorf in August...

|> more attractive to me. Can the "super_78" program (sets SVGA screen
|> to 78Hz scan rate) be used for changing resolutions?
As one of the two authors of Super_78 i can assure you that this mini-prg does nothing like changing resolutions. At the moment we are planning to sell a good screen-resolution-software together with a little hardware. The hardware even increases the range of resolutions and refresh-rates. But the software also works without external hardware (800x600, 256 col. in 83Hz flicker-free-interlaced). We are not shure wether to sell this software also as a stand-alone version - depends on your interest. And we don't know how high the price could be. everything is in the planning stage now. but we don't want to hurry - there are not that much falcons around up to now. just wait and see --- and buy a good monitor...

Just to note - I think you can set Gemini to "overlay" mode, whereby
it "unloads" itself when you run a program, and then re-loads itself
once that program is complete. This would probably allow you to run
it on a system with smaller amounts of RAM. Of course, you'd probably
need a hard disk to make this method worthwhile. How this would
work under something like MultiTOS, I don't know, but then again
if you only have a 1 meg system, then MultiTOS probably won't be
a good idea to use anyways :-)

4719. CeBit report

Newsgroup: comp.sys.atari.st
Date: 1993-03-29 15:19:41 UTC
From: tsstoeck@cip.informatik.uni-erlangen.de
Message-ID: <1p742dEc7@uni-erlangen.de>
Source record: 208055

Hi there.

Well, actually this is not a fully report. There are only those things
mentioned, which I and my companions think they are worth it.

1. HP Laserjet IV / HP Laserjet IVM

If you wanna buy a Laser, buy this ! I asked the guys to make some
italics on it. They did: 4Punkt - we could read it. 3Punkt - we could
read it. 2Punkt - we could read it. It's the best quality Laserprinter
I ever saw.

2. Toshiba presented a new LCD. It's an active LCD Color. You can look from
every point at this display. It IS better (far better) than common
monitors. Toshiba is going to put this in their 486 Notebooks.
These Notebooks are going to be really expensive. (9500-10000 DM)
The LCD alone costs 4000 DM. But I hope this is going to be cheaper.

3. IOMEGA.....

You better should remember this name in future. They are manufacturing
the Bernoulli and Floptical drives. I'm going to buy some floptical
drives, to test how they can be plugged to the ATARI-plattform.
Main features of floptical: 20,8 MB formatted capacity on 3.5" disk.
You can read,write and format 720K and 1,44MB disks.
I was told, that IOMEGA is planing a special advertissement:
You can send them your Floppy drive and get a floptical cheaper.
The price of a floptical drive is about 500DM (dunno what US$ they
want) the price for a 20,8MB Media is 20DM. That's cheaper than
normal HD-disks !

Ciao
Rico

If I recall address 127.0.0.1 is a loopback into your own machine. If you
logged in with your user and password you were probably looking at all the
files that your account contains. You should be able to figure out what
machine you connected to by looking at the response when the connection
initially connects.

Hmmmm... you can buy these floptical drives right now here in the US for US$399, which includes the drive, external case & power supply, ICD Link SCSI host adaptor and a 21 Mb floptical disk. Have never heard of anyone offering an exchange program for a standard floppy drive, however.

BTW, anyone know what's the current exchange rate for DM -> US$?

Go with GEMINI. DC-Desktop is feature-starved, as is Teradesk (differing opinions not-with-standing).

I run it on a 1MB machine with no problems (recommend that you have a hard drive). There are several options you have when launching a program - GEMINI uses a small program called runner that basically saves the context of GEMINI when running programs, thus saving you a lot of memory taken up by GEMINI. It comes with a good, Unix-like console window, scripting capabilities, and hooks for external programs. I like it. Your mileage may vary.

cfaehl@vesta.unm.edu

4723. Has Atari Abandoned the Falcon US Market Already?

Hmmmm, it's almost April and no US Falcons. Could it be that Atari has decided that the Falcon just cannot compete with the Mac Centris and Mac III as well as cheap PC clones and has decided to recoup the development costs in the European market exclusively?

Could it be that they are now placing ALL their hopes on the Jaguar?

Bob Brodie's been awful quiet since the announcement that the Falcon wouldn't make it out this March. And over in the Lynx department, only one cartridge has been released so far this year, Hmmmmmmm.....

Golly Mr. Tramiel, I wonder what you're up to...

A pity, all those stories about the flexible resolutions, using the DSP to instantly clear large areas of memory, and the fast gouraud shading are mighty intriguing...

FWIW, I have tried all versions of Serialfix and the only one that actually worked on my STe (tos1.6) was the second one (v1.1 I think). The first one (v1.0) and the latest one (v2.0?) absolutely DO NOT WORK on my machine. For downloads or uploads. Also while I'm at it, I can't stand their CPX which goes to all that trouble just to set one flag for their stupid program (and in one of the versions, the CPX ITSELF DIDN'T WORK!!) You set the flag, "save" the change, exit the CPX, go back in, and it's still at the old setting. I refuse to bother with those clowns anymore until they test their software. BTW, for whatever reason, TURBOCTS 1.32 works perfectly for me all the time, plus it doesn't need that stupid CPX. (Written by the same guy though?!)

What a stupid thing to post. It's a disservice to the Atari community to post such drivel, at least until Thursday morning ...

For those who DON'T know -- 127.0.0.1 is defined in most host tables as 'localhost'. Basically, you'd be FTP'ing directly back into your own machine. Of COURSE your username and password work. Of COURSE, there is absolutely nothing there which you don't already know about.

That's right, and it's why Tandy Oz are selling them at all. Up until now, Tandy here (who are actually a seperate company) have had nothing to do with the ST. Atari Oz obviously wanted to get rid of their surplus STe's as quickly as possible - and Tandy obviously got the job.

The fact that Tandy's advertising agency are utterly stupid (I have spoken with a local dealer who saw the copy being proudly shown to all and sundry by the head of said agency) has very little bearing on anything, really.

Where is the english version of Gemini? I believe I got it once, but it was in German. (Unless I'm thinking of another desktop program..) And what is the latest version number?

I have NeoDesk right now, but haven't seen any updates to it for a long time. Its nice, but it lacks things, like a command line, that would be nice. Its printer queue system is nice, but since I use a laser anyway, it doesn't matter.. :)

Thanks.

Atari 1040STf for sale

$300

---

upgraded to 4 Megabytes RAM.

internal double-sided floppy drive.

excellent cosmetic (& functional) condition.

lots of public domain utility (& other) software.

mouse included

I'd prefer to sell locally (in the San Francisco south Bay Area), so
my first preference will be to locals, but will consider shipping vast
distances as well.

Email me if you need more specs.
Thanks.

I'd like to sell off some editor/librarians I don't use any more.

K1 ed/lib from Interval Music (formerly Drumware) $50 or best offer

full-featured program with

random or controlled patch generation (a bank at a time),

support for effects on K1 II

graphic editing of keyzones (splits & layers)

editing of all K1 and K1 II parameters

standard things like envelope editing, librarian, etc.

CZ101 ed/lib ("CZ Android") from Hybrid Arts $25 or best offer

graphic editing of all CZ101 params, librarian, "intelligent" patch generation

(This program works best with TOS 1.0; later versions will work, but
there will be some graphic anomalies in the user interface).

Thanks for this wonderful news! I'll be waiting "with baited breath". (Not sure how well that expression translates into German {^;) What I'm wondering now is for programs that offer movable, scalable windows, (not necessarily GEM ones) - Cubase in particular, will there some compatibility concerns?

Look what you can get for only $500. It's the perfect starter system lacking only a printer and we can talk about that! I need to sell this system so that I can pay my taxes. It works great and you'll not find a comparable system anywhere at this price.

Atari 1040ST (M68000 16bit GEM based GUI system)
W/Rainbow TOS 4.1
2.5MB RAM
3.5" 720k internal floppy drive
1 Parallel port
1 Serial port
1 DMA port
2 Mouse/Joystick ports
2 Midi ports
1 Cartrage port w/clock
1 Floppy drive port
1 HiRes Monitor port

1 Color Monitor
1 HiRes Monochrome Monitor
1 Monitor Switch Box
1 External 40MB Hard Drive
1 External 3.5" 720k Floppy Drive
1 1200baud Modem
1 MagicSac Mac Emulater Cartrage w/ROM's

And TON$ floppies and also software and manuals and misc odds
and ends.

*** At this price you will have to pay the shipping. ***

Again, I am only asking $500 for the complete system. If interested, reply
via E-mail, Here or Call me at 503-696-5910 before 7pm and at 503-649-4748 after 7pm PST.

Message-ID: <1993Mar29.200138.9964@edinboro.edu>
Source record: 208083

Does anyone know of a way to convert .PNT files to something like GIFs?
I am not an ST owner, but I would like to view several .PNT files that I've acquired. To be more specific, I would like to view the Falcon screen shoots that are in the Falcon directory at Umich. I really only have access to PCs (and my trust ol' 8bit) so I would need to do the conversion on the PC.

I hope to be buying a Falcon30 somtime in the near future, and I would like the opportunity to at least look at the desktop.........

[impressive list of formats deleted]

But, it is something of a memory hog. I can view only the smallest
of JPEG files on my 1040 ST. Unfortunately, I find this out
after GVIEW goes through the color compression and finally
attempts to display the picture only to say something
like "185 K needed to view picture, 120 K available".

Uniterm works in the ST-compatible video modes, as long as MultiTOS is Not
running. My overscan-compatible patched version runs in the 2 and 4 color
modes in regular 640x480 resolution as well, but doesn't cope with more
bitplanes than that. (oh well.)

Source record: 208076

I would like to buy some used Atari ST games...

Since I haven't got a dealer around here and buying games new is a lot more expensive, I'd rather buy used games. So if you've got a few that you bought once but now you're sick of or conquered, send me a list and you're asking price. A few that I would like:

Dungeon Master (both versions)
Rambo
Liesure Suit Larry (all versions of this kosher game) (no insult meant my Jewish friends)

Ah hell, if it has a cool title I'll probably give you $5 for it. If its worth it I'll pay more. I'm also looking for a copy of WordPerfect 4.1 for Atari.

Source record: 208081

A few lines from the DocFile...
for mbrowse.zoo

jc cummins@a.cs.okstate.edu

MasterBrowse is a replacement text file viewer for any Atari
computer, in any resolution. It offers many features that the Atari
text file viewer does not:

* MasterBrowse can use the command line (of course) to get a list
of documents to load. The ARGV, xArg, and standard command
line formats are supported.

-You can jump to a specific line, a specific page, or any
of ten "bookmarks" that MasterBrowse supplies for your
personal use.

* MasterBrowse also offers you the ability to search for a string
inside a document (case sensitive or case insensitive). After
the string is found, another command may be used to find the
next occurence of the string.

* MasterBrowse also has block functions. You can mark a block
off, and then save it to disk or print it. More details on
the extensive printing features offered by MasterBrowse can
be found below.

* Printing? MasterBrowse is a master printer. It can print a
document (or a block) with page headings, page numbers, line
numbers, or a combination of the three. It can even print an
identification string for those people who share a printer
between more than one computer.

4743. hard disks and the ICD Link

Newsgroup: comp.sys.atari.st
Date: 1993-03-30 02:20:44 UTC
From: jhauser@pine.CS.Berkeley.EDU
Message-ID: <1p8aps$j37@agate.berkeley.edu>
Source record: 208077

Last month I set up a hard disk system for my old Atari 1040 STFM using the ICD Link adaptor, and I thought I'd share some of my experiences for the benefit of any other neophytes who may be embarking on the same path.

First let me say that anyone contemplating buying a new hard disk to hook up to the external DMA port of the ST should look seriously at getting ICD's Link and a Macintosh-style ``external'' SCSI hard disk. Your experience may differ, but I could not find a better deal. In particular, it was definitely _not_ cheaper for me to build my own from a bare SCSI drive, since there appears to be about an extra US$30 mark-up on the case and power supply when sold separately. The prepackaged Atari-specific hard disks do not appear to be any cheaper, either.

Prices on hard disks are dropping by the minute, so you should not rely solely on the prices you see in advertisements to make your decision. Call around.

That much said, there are some caveats:

The first and most important is that the Link (or is it the ST?) cannot deal with parity on the SCSI bus. PARITY MUST BE DISABLED. This is not made very clear in the documentation that came with my Link (which, in fact, has practically nothing to say about the Link hardware at all). Parity is supposed to be an optional part of the SCSI-1 standard, and vendors who support parity are supposed to provide a way of disabling it. Many SCSI hard disks have a jumper on the disk for doing this, although there's no guarantee the jumper will be labelled in any obvious way. If you're not familiar with a drive, I recommend getting technical support from the company you intend to buy from BEFORE YOU BUY.

The SCSI standard notwithstanding, I am told that SOME OF THE NEWER DRIVES HAVE PARITY THAT CANNOT BE DISABLED. For instance, ICD Technical Support told me that all CONNER drives with model numbers starting `CP3...' are this way. Since these are the most common Conner drives around these days, you might want to shy away from getting a Conner drive. QUANTUM ELS drives don't have a jumper for disabling parity, either, although parity can reportedly be disabled on these drives with the proper SCSI command. Unfortunately you can't do this if you can't talk to the drive with parity enabled in the first place, so this isn't an option if all you have is an ST and a Link. Moreover, you'd also need a software utility to send the right command to the drive; and even then, ICD claims that _some_ of the Quantum ELS drives lack this ability, anyway. So it'd probably be a good idea to forget about QUANTUM ELS drives, too.

There may be other drives that have this problem; I've mentioned all the ones I know of. If anyone else out there has more information, it might be

nice to share.

The other thing to know about the Link is that it needs TERMINATION POWER from the drive. (The name comes from the fact that this power line is really intended for use by the SCSI bus terminator.) I'm not aware of any drives that don't have this capability one way or another, but, once again, you may have to mess with the drive's jumpers.

ICD recommends MAXTOR drives, apparently---at least for the smaller sizes like 120 MB, which is what I got. I've yet to have a problem with my drive.

As for the case: External SCSI hard disks for the Macintosh are almost universally packaged in what's called a ``zero footprint'' case, which is about 11 x 11 x 1.5 inches or so. The idea is that this will fit snuggly under your monitor and so not take up any extra space. In my case, my monitor is set up on a monitor stand overtop my 1040 ST; and while the stand is strong enough, it only has two legs (like some chairs you may know), so it's prone to shaking. It's O.K. for the monitor, but there's no way I was going to set my harddisk up on that stand, and a ``zero footprint'' case obviously has a pretty substantial footprint otherwise. Cases that are smaller than the zero footprint ones are generally called ``portable''. (That would be ``portable'' in the sense that a brick is portable, I suppose.) Unfortunately, these cases are significantly rarer than the zero footprint ones. Fortunately, when they can be found, they don't appear to cost any extra as a rule. The difference in size was important to me, though it might not be to you.

I bought my hard disk through an outfit called APS Technologies, which is a fairly large Mac (and PC?) mail order retailer. I know they can be found in the major Mac magazines; probably elsewhere as well. I highly recommend this company. I first ordered a Quantum ELS drive from them---mistake---and was able to return it under their 30-day money back guarantee with only the shipping and handling cost lost. I then turned around and (more the wiser) got the 120 MB Maxtor drive.

If you order from APS, don't forget to ask for some ``jumper blocks'' if you think you'll need them. They tossed in a small collection for me just as a service. You should also know that APS has at least two packagings for their drives. In the ``Mac'' version, the drive comes formatted for the Macintosh and is loaded with a host of Macintosh software---mostly public domain stuff, I'm told---none of which is useable under TOS. There's also a sticker at the back of the case, the breaking of which voids your warranty, so setting the jumpers is made a bit tricky in this version. The ``PC'' version comes with none of the Macintosh-specific stuff, nor the sticker. Instead you get information about setting the jumpers. You'd probably want to ask for the ``PC'' version.

That's it; that's what I learned. After all this typing, I sure hope this information is useful to someone! It seemed to me like I had to learn more than I wanted to on my own; maybe I can save someone else the trouble. To that effect, please feel free to distribute this information in any way you see fit (like uploading it to bulletin boards, etc.).

Oh yeah, and don't kick the desk during a low-level format!

``Why, yes; I *do* speak for the entire University of California system.''

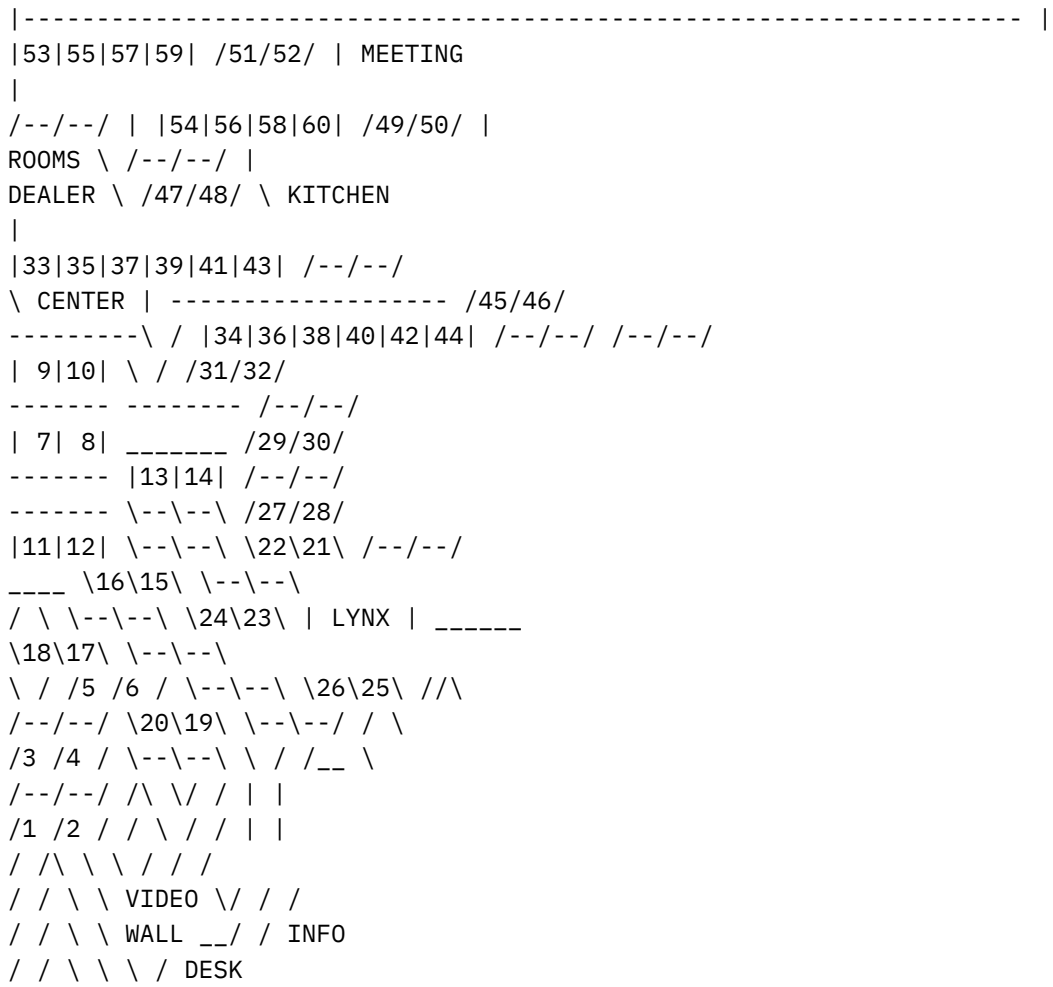
Here's an overview of CeBIT from Atari Benelux on Genie:

ATARI.BENLUX [W. Kilwinger] at 15:26 EST

Atari Booth at CEBIT'93



Portfolio

Here is the list with developers, I'm not sure this is 100% accurate since
they made some last minutes changes.

1 Infogrammes, Alone in the Dark

2 Praefcke, PCB-layout, GAL-editor, Chemical Structure/formule editor

3 Eurosoft, Photo Studio (Falcon030), Home Video kit

4 Victor GmbH, Integrated Software, Databases

5 Artiplus, TopCard's (business card printing)

6 Purix Software, Script 3

7 Digital Data Deicke, Falcon housing, external keyboard (199 DM)

8 DVPI GmbH, Music Software, Portfolio MIDI interface

9 Digital Data Deicke

10 GE-Soft, Falcon030 32-bit SIMM memory expansion with 33Mhz 68030

11 Richter, GFA Basic, OCR, Render/Animation software

12 Steinberg, Cubase Audio (MIDI and Harddisk Recording)

13 Richter, Lexicor render/animation software

14 Steinberg

15 Logitex, DATAlight data compression, 1ST Card database, 1ST Lock

16 Inshape, raytracing, animation, 3-D modelling

17 OverScan, Video titling, Genlocking

18 Compo, Falcon Speed emulator based on 80286

19 OverScan, Grafics, Video titling, animation, ScreenBlaster

20 Compo, Musicom harddisk recording (with digital interface)

21 Yeti (and Brainstorm), Yeti software, Falcon DSP JPEG, DSP MPEG

22 HiSoft TruePaint, Lattice C

23 Silmaris, Ishar Falcon030 game

24 Oregon Research, Diamond Edge harddisk optimiser on Falcon030

25 Team Computer, Video Production

26 Atari, Falcon030 with misc. applications

27 Jobis, Falcon Tower, office software

28 Jobis

29 PAM software, ethernet software, TCP/IP, NFS, Novell, FalconNet

30 Trade-It, Chacall image processing on Falcon030

31 HTA 32 Trade-It, DigiTape 8-channel harddisk recording on Falcon030

33 Biodata, Bionet network for Atari, PC, UNIX and Apple

34 Atari, Falcon030 software utilities

35 ICP Verlag, TOS Magazine, FastCopy Pro

36 Eickman Computing, Falcon030 Tower

37 VHF computer, Falcon030 with CAD software

38 Atari, Falcon030

39 VHF computer, converter for vector formats

40 H3 systems, Falcon030 with DA's Vector animation software

41 Atari, Calamus S on Falcon030

42 Color Concept, Kodak Photo CD software on Falcon030 and TT

43 DMC GmbH, Calamus SL

44 Color Concept

45 TKR, Crazy Dots graphics card, FAX software

46 TMS GmbH, Cranach

47 TKR

48 Atari, Falcon030 demo software

49 Rhothron, Falcon030 in 19" rack, process control/measurement

50 Application Systems Heidelberg, Signum!3, Papillon graphics softw.

51 Rhotron

52 App. Systems, Pure C, Pure Pascal, Phoenix database

53 Atari, Falcon030

54 Atari, Falcon030

55 SDS. Information Management

56 Digital Optical Analog, Blackmail Falcon030 Voice Mail system

57 Matrix, Falcon030 with MatDigiR video digitizer

58 R.O.M. Software, Papyrus word processor, DTP Module, Office Module

59 Matrix, TT/Mega STE (true color) video cards

60 STAGE Microsystems, office software

I counted at least 38 Falcon030's on the booth. The presentation on the Video Wall was very good. A part of it was live, a part of it was a product video showing several good Falcon030 software titels. Steinberg used the wall also for presentation of Cubase Audio.

Lot's of very good Falcon030 applications were on the booth but also new or updates software for existing ST's and TT's.

I leave it to others to publish about the software they saw but I'm available for answering questions.

NeoDesk lacks a command line because Gribnif sells that as a separate
product - NeoDesk CLI which is a NeoDesk Accessory with a rather complete
shell language and can even run .TOS and .TTP programs in its acc window.
I've got it, but don't use it all that much as you can do so much from
NeoDesk itself...

] Go with GEMINI. DC-Desktop is feature-starved, as is Teradesk (differing
] s not-with-standing).

Teradesk!? Feature starved!? Which version?

Ignoring external shells (such as MUPFEL), Teradesk has quite a few
more features! (I'll have a look at the last Gemini later, and see if
I can do a comparision).

Teradesk is also a LOT smaller and faster than Gset seen /thread

Gemini!

Depends on your pref's I suppose, Gemini, 2meg of RAM is minimum due to
the large executable size preventing you from running any large
programs. Teradesk will run okay in 1meg, but still, I can't see how
anyone operates properly in less than 2meg of RAM! (1meg using
plain old TOS 1.2 is almost unbearable....)

From: awest@ub.d.umn.edu
Message-ID: <1p8k9mlNNg9m@ub.d.umn.edu>
Source record: 208084

Hi all...I have GDOS almost up and running...I have assassin of GEnie to help me make my assign.sys file. I got it all made, but when I try to boot up I get this message:

"blank line or <something> expected after ID..."

Something like that...then it says GDOS not installed...

Any ideas?!

Also...is an .inf file a driver for my printer? (printer.inf with OPUS spread sheet, or am I using the wrong thing?!

Thanx
Andrew

4750. Atari ST Questions

Newsgroup: comp.sys.atari.st
Date: 1993-03-30 06:17:06 UTC
From: tommyl@stud.cs.uit.no
Message-ID: <1993Mar30.061706.25463@news.uit.no>
Source record: 208085

I ftp'ed some PD games from an ST site, and wondered if Atari reads/writes PC disk 'directly', that is, can I format a disk to PC 720 kb format, place files on it and expect an 1040 ST to read it/boot from it?

And could anybody recommend an ST Ramdrive, preferably a dynamic one, but a fixed-size type will do.

Please reply in mail as I'm not up to reading this newsgroup too... :)

I have some docs that show how to install 2 video shifters to get a 32768 color pallete! Of course, it doesn't come with schematic or circuit diagram, justa parts list. The creator said it would be too much trouble to include them, but he'd send hard copy if someone wanted him. E-mail me and I'll post it here with his address if you like.

A> combination hardware/software emulator that runs ST stuff full speed on
A> about a 486-25. You can do all sorts of neat things like install different
A> versions of TOS, run TT modes, etc. I believe it runs in MS Windows...

Yep, same guy that wrote the Xformer and then complained when new TOS versions and the STe came out. Seems he didn't like atari upgrading hardware because it made it harder for his emulator to work. He HATES Atari now and has slandered it more than I care to say. GEMulator needs a 486/25 at 8MB RAM to emulate an 8mHz ST, to emulate a MegaSTE you need at least a 486/50 and graphics and register operations are still FAR below what they should be. And that is DOS speeds. Under Windows is VERY slow. And it costs about $400 for the thing too.

I can 2 1040STEs for that price! Or I can get a 1040STE with 4MB AJAX upgrade, and TOS 2.06 and have some money left over. Or maybe I could find a used MegaSTE. The hardware is a card with TOS versions on it. The software is shareware. I'd like to take a look at the software and see if it would work with a boot-TOS. Maybe I could dump my TOS 1.62 ROMs to disk to see if his software works. No way am I gonna pay $400 on hardware to see if the software works.

a> ^^^^^^^^^^^^^^^^
a> I haven't noticed this point being made during the discussion. It is a
a> _big_ reduction - a throw-out price, in fact.

The 1040 STE is $399, but you can get a 520STE by mail order for about $299 and then you can upgrade it to 4MB through some cheap SIMMs which would cost from $100-$120, or less if you know where to look. The Falcon is $899.

Different machines here folks. Sometimes I wonder why I believe anything on this Net.

t> > Yup!.. expecially since both the ANTIC and the COPPER where designed by
t> > the same person.
t>
t> So why don't any other Atari machines (ST, STE, Falcon) have an ANTIC/Coppe
t> chip?

Geez, we can't get any pickier and rediculous can we? Those people work for AMIGA now, we got the Tramiels. Not really an even swap, IMHO.

Anyway, its quite simple. These are different computers. However, comparing the Falcon's video to an AMIGAs video and they are VERY similar. In this day and age, there really isn't a reason to have such things as Display list driven graphics. If you want it, buy an AMIGA, if you don't, get an ATARI.

Simple enough ain't it? Why do all te damn AMIGA users walk around like lost souls trying to make everyone (including themselves) believe they have a better computer than everyone else. The mani reason why I don't want an AMIGA is because of all the insecure AMIGA folks in the ATARI newsgroups.

4766. Ada on the ST

Newsgroup: comp.sys.atari.st
Date: 1993-03-30 11:31:27 UTC
From: mjl-b@minster.york.ac.uk
Message-ID: <733491087.8111@minster.york.ac.uk>
Source record: 208140

(There was a bit of disucssion on c.s.a.st.tech about Ada; I thought it more appropriate to move it onto this group)

Someone asked if there was an Ada(*) compiler for the ST. My answer is: I'm not sure.

There is a free Ada interpreter, AdaEd, available from New York University. There are versions on various platforms, and rumours persist that there is an ST version. However, I have been unable to track that ST version down.

Sometime this year (I forget exactly when), the GNU Ada9X compiler will be released. [Ada9X is the recent revision of the language, giving it full OO support and other goodies. The X in 9X is likely to be '4'] The front end is written in Ada, and the code generator is the usual Stallman GNU job (with some extensions to support modern language features such as exceptions).

I've seen the front end of GNU Ada9X at work, and the folks at New York University have done a superb job. The error recovery is particularly excellent. I'd like to do an ST port, but there are a few problems:

1) I only have a 2MB ST -- I would guess that a 4MB ST is a bare minimum, and a Falcon or TT more comfortable for development work.

2) Since parts of GNU Ada are written in Ada, we need an Ada cross-compiler targetted to the ST (GNU-Ada running on another machine but generating code for the ST would be fine).

3) GCC requires a 4MB ST. Ada is a larger language than C++, so the finished compiler is likely to require more memory than this. However, the GNU Ada people aim to have it working on a PC under DOS, so memory may not be a problem.

That's the state of play at the moment -- if anyone has any comments, please mail them to me (but be prepared to wait for a reply -- I'm going away for a few weeks).

(*) ADA is the American Dental Association. Ada is the computer language named after Countess Ada Lovelace, daughter of Lord Byron and patron of Charles Babbage. Babbage developed the difference engine -- the first computer -- so Ada Lovelace was effectively the first programmer.

Source record: 208093

Hi,

This week my brother in law in spe asked me the following question.

He also has an Atari ST and wants to include his computer in the Novell network (under Ethernet) on his work. My first reaction was, that it wasn't possible cause I haven't heard/read about the existence of software- and hardware which is required.

Is there anybody out there who knows more about this ambiguous effort?

Greetings, Jeroen.

[some back and forth desktop-religious prattle twixt myself and specifically Steve Wells deleted - he's an avid TeraDesk supporter, I like Gemini]

TeraDesk: I couldn't see all the features you were alluding to - it's well possible that I am working off info of an older version. Your points about Gemini don't apply - you can indeed run Gemini on a 1MB system, and still run useful programs. That's done through the overlay mechanism of Gemini, and
begs for a hard drive. I'd be interested in what you see are the main benefits of TeraDesk, and where Gemini falls down. About speed - I confess I don't know what you're talking about there, I haven't noticed any problems with sluggishness with Gemini.

I highly recommend Diamond Edge. Sure it's expensive, but not nearly as
expensive as a new hard drive, or the cost of losing some important data
if you use an inferior PD utility. In many cases I prefer PD software
over commercial, but Diamond Edge is very well written and supported and
I don't think you can beat it. Between that and Diamond Back, I can
rest assured all my hard work and investments are secure.

4774. Re: Falcon compatibility list?

Newsgroup: comp.sys.atari.st
Date: 1993-03-30 17:18:34 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Mar30.171834.12181@mnemosyne.cs.du.edu>
Source record: 208100
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have yet to find a piece of non-game software that doesn't run on the Falcon, with one big caveat: some things only run in ST-compatible video modes. (Tempus falls into that category.)

This is using plain TOS 4.0x. I've found a variety of things that won't run under MultiTOS on the Falcon.

j>and solution?

Falcon030 have a new high speed serial controller chip, replacing the old and slow MFP chip. Software programming the MFP directly won't do anything useful, obviously. Try CoNnect version 1.90 or higher. Your friend will encounter a serial speed of up to 153000 bps...

f>This makes sense to me! TT medium and VGA aren't exactly the same, which
f>explains the thick, white block on the left side of my multisync :-).

TT and VGA display are the same in frame rate and horizontal scan rate.
The difference is, the TT has a narrower screen within the display width,
giving the famous :-(useless border on the right.

That's because the TT uses 32 MHz pixel clock, whereas VGA is 28 MHz.

>Cottonwood Computers compiled a fairly lengthy list of the results of their
>Falcon compatability tests which was posted here a few weeks ago and was
>also reprinted in Z-NET. It was mostly (all?) commercial software as I recall.

I think what is needed is *3* lists. Kind of a pain, you say? Well,
there would be advantages. The lists would be:

1) Works under MultiTOS:
2) Works without MultiTOS:
3) Works in ST resolutions:

The first level would be the more flexible software - things such as
Gemview, ConNect, Calamus (?), and other programs which would work in
any variety of screen resolutions, and that would work well under
a multitasking system (in general, would be fully GEM based). These programs
would take the best advantage of the system in it's most powerful mode...

The second level would include those programs that would work on the
Falcon in single-tasking mode (since you don't *have* to have MTOS boot
in). This would probably allow some programs to work (or work better,
i.e. Arcshell and such programs that "take over" the screen)...

The final level would include those programs (primarily games) that
would *have* to be run in a standard ST resolution (generally ST low
games, etc). Primarily those programs that check for the ST Mode
(1 = low, 2 = medium, etc) rather than checking screen size. This
level would probably be best under single-tasking mode as well...

This would help you know if (1) the program will work on the Falcon at all,
and if so, in which mode. There might be some other settings that need
to be changed to work (i.e. turning off cache, using something like
the TT's 24bit.prg program, etc), but I would think the three I mentioned
would have the greatest impact on whether a program would work or not...

What do ya think?

: Is such a device available on a ftp-server? Or a normal program, which
: backup data on a streamer?

There are a couple of packages available for a regular ST system; at least
one of those runs fine under MiNT (just put it's driver in the auto folder
before mint.prg).

I am working on a full driver that would install itself into the MiNT
"u:\dev" directory that any program that does file I/O could access;
similar to the tape driver device files under Unix. The big problem is turning
out to get the driver to work with different kinds of tape drives; they
don't have "completely" compatible command sets.

Atari in BIG Trouble.

Recently while checking out several stocks on the open market, I took a chance to look at my favorite computer, Atari. Now sitting at 1 and 1/8 on AMEX, Atari looks to drop to an under a dollar stock in the next quarter.

This is bad enough without the following. I checked out Motorolla and Intel. Motorolla had a small story about how Atari had still failed to pay them for the 68030's and DSP 56001's that were being used in the Falcon. Also the custom RISC chip they co built and designed with Atari is also unapid. Basically, Motorolla is quite pissed.

WHy all this trouble? Atari does not have the MONEY to pay their bills, yet alone build the Falcons in mass quantity, which is the heavy rumor as to its real delay in mass release.

While I will use my ST until the day it croaks from over usage, I doubt Atari will be around in a year. And just to mention, Commodore is right behind Atari at 4 and 3/8 and falling fast. It is expected to end up a 2 dollar stock by June.

I am in the opposite boat. When I finally get $$ back from the
insurance people, I want to be able to convert several wonderful GIFs that I
have into .PNT format so that I can use them as background pics using Warp9
(thank GOD the disks weren't stolen...just the computer with the HD that had
all those painstaking hours of badgering, cajoling, and cursing MiNT and GCC
and Ghostscript into working together, not to mention all those hours of
downloading the MBs of binaries, libraries, etc. <sigh>).
Does anyone have a (preferably) public domain or shareware pic
converter from GIF to PNT (I would suppose that if I wanted to go the other
way, that Gview2xx would work, but since I'm not....)? I'd rather not have to
buy Prismpaint just to convert between the two formats....

The question I have is, will it support tape drives on the SCSI port,
such as found on the falcon or the TT, or only on the ACSI port as all other
tape software I have seen? Why is is so difficult to support the SCSI port?

If someone knows of software that _does_ support the SCSI port, _I_
would be very interested in knowing about it. PD/SW software is prefered,
but I am willing to buy a commercial version if it is well implemented,
relatively bug-proof, and of a reasonable cost (say $50 US or less).

I can believe this, also - when you have a negative cash flow, things like this have to be the way you operate.

>

It's AMAZING, ASTONISHING, INCREDIBLE that Atari has lasted this long. Who's to say where they'll be a year from now?

This isn't necessarily true. There's been another machine added
for ftp recently. If you get the one with restrictions, try again.
It doesn't take me all that long to get to it from UMinnesota.

Also, be sure to use AFS (if you have it) or gopher (archive.gopher.merit.edu)
before using ftp. Thanks.

Atari had $60 million in cash 6 months ago, I doubt that they are not
liquid enough t to pay their bills.

I>

[some stuff removed...]

The question I have is, will it support tape drives on the SCSI port,
such as found on the falcon or the TT, or only on the ACSI port as all other
tape software I have seen? Why is is so difficult to support the SCSI port?

Why it is so difficult ?
Well, because there are hardly _no_ documentation on the port.
Not even in the dev. kit !!!
You have to buy it separately :(

If someone knows of software that _does_ support the SCSI port, _I_
would be very interested in knowing about it. PD/SW software is prefered,
but I am willing to buy a commercial version if it is well implemented,
relatively bug-proof, and of a reasonable cost (say $50 US or less).

Well, a friend is working on it right now. I'm urging him to make a device
driver that fits in u:\dev. So far he has got the reading going, but
DMAdriven writes gives parity error... Oh well, I'm sure he'll work it
out...
You could encourage him by writing to stigpo@pvv.unit.no
(Hei Stig :)

Yes, it refuses logins after some preset number of users are already logged in. There is an alternate 'mirror' site I've used frequently at Washinginton Univ. in St. Louis; unfortunately, the name isn't in the FAQ (where it probably belongs, especially since a.a.u.e is so hard to get access to). However, try ftp archive.wustl.edu

Atari may be a bit crazy, but it ain't dead yet.
All you dudes that keep saying that Atari is gonna be gone in a year or six months keep thinking that Atari is a clone company, or somebody with competition that will force it out. Atari stays alive because of its peculiarities, not in spite of them. Clones come and go, but Atari stays with us because those of us that are addicted to the Jakintosh will continue to use these hulks until we die.
If you keep looking at Atari from the standpoint of price, components, support, availability, and other technical aspects, you are missing the most important advantage of Atari. You're forgetting that as long as it has the Atari name on it, there's people out there that will buy the damn things just for old times sake. Same with Amiga. Non-clone/Mac computers are cult computers, and theres a certain amount of power there.
Enough to keep Atari and Amiga alive? Who knows? Every ST/STe owner around here is selling off their machines for tiny prices just to be able to have that much more for an expensive overpriced unavailable Falcon. Mind you, these aren't jet-set androgynoid college-educated Top-40 comp-sci grads. These are beer-drinking hairy men with families and ratty old station wagons. They don't give a shit about how many megahertzes and pixels and spreadsheets it has. They just know that if it says Atari, well then by God they can have something to do at night besides watch TV. Like what?
Mess with the hard disk. Play a pirated video game. Put on cardboard 3-d glasses and mess with a drawing program. It doesn't matter if the thing only has 16 colors, its something to DO! Atari has enough wierd perks that part of the fun with it is to figure things out and wonder what the hell Jack Tramiel was thinking on that one.
No, Atari isn't gonna be forced out by faster, smarter, prettier, cheaper clones or macs. Atari and Amiga will last not because they win the technology race (he who dies with the most toys wins). They will be around because they're fun wierd computers that their fanatics just can't live without.

David A. |||

Really, who posted this thing on Atari being in trouble? You give
us a few stock prices (hardly enoughto establish a trend by any
stretch of the imagination), and predict that the price will fall
below $1. Then you tell us about how Motorola (only 1 "l", thanks)
is "pissed", etc. If we heard about every time a company was late
paying its bills, we wouldn't have time for much else! Before
giving us your expert financial opinion of Atari, how about filling
us in on things like the SCF, profit ratios, and the IS?

These prices are being lowerd as I write this. I talked to the Paul Welsh who is the atari representative in charge of England and Scandinavia. He had also been told of the outrageous prices in Sweden. He told me that Adastra (the swedish importer) was comming in for a meeting at Cebit. The thing he would point out to them was that and I quote "It shall not be cheeper to buy an atari from another country than the one the consumer lives in."

This is good news and I hope it clears up your questions. qI have taken fotos of the new hand controller

If what you're talking about is Z-keys, I bought one once and returned it.
1. The HELP and UNDO keys won't work with an IBM keyboard.
2. You have to get a special cable to run it off an old-style 520. 3. It doesn't work reliably with Spectre GCR for Mac Emulation.

If none of these apply, it might be what you're looking for. As far as general operation, it worked fine, these things just bothered me too much.

>Now, I'm just looking forward to Dusseldorf in August...

I am too, but then we better remember a certain piece of paper for you
too...right? ;)

I just thought I would add some other news at the atari stand...

Silminaris said they where finished with two Falcon spesific games, Transartica and Ishar. Wroom II from Lanchor looked finished. Space Junk looked very good altough it was only a demo. Eclipse from Eclipse (a 3D space game in 320xc200 true-color) looked very smooth even though they have not yet implemented the DSP routines.

Transartica and Ishar where both in 256 colors with 16 bit sound, I only saw Ishar..It looked good.

Wroom II looked very good too, but the only problem was that it was a bit fast for me. The game is Wroom I with a new feature called multi-player.. four players on screen at the same time. This mode didn't seem to slow down the game anything. The graphics looked better altough I am not sure It was because I didn't find any people from Lanchor there. The sound I can't say anything about because I never took time to study the game too good.

Eclipse will not be released before another 6 months. at least that was what a guy on their stand told me.

Atari have also released a leaflet stating all the products comming out for the Falcon. The list was very uplifting for all atari entusiasts. There was a lot of great software comming out in the near future. Some of them is already finished.

Greetings

Rune Hyldmo, anti sig.file activists

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

>I've got it to work now (at least, I think). I uses XYZ202B instead of
>GemZmodem and everything has worked OK since then...

Since you guys are discussing hi-speed modem problems, I thought I'd throw in a problem I've been having...

I'm using a TT w/TOS 3.01, ZyXEL 1496E (5.05), STalker 3.01, AUXINIT.PRG and RS232ENC.PRG.

My problem is this: I start a download with STalker as an accessory, and then run a TOS (GIFDCDTT.TTP for example) program. After about 20 seconds or so, the 'receiving data' light on my modem will go out. When I exit from the TOS program, the tranfer does not continue, it just hangs and I am forced to abort.

I think I know why the xfer stops when I'm in a TOS program; once the 31kb buffer set with AUXINIT.PRG is filled, the computer tells the modem to stop sending data (is this the DSR or RTS?). STalker can't do anything, as it can only empty the buffer when the AES is active (right?). But when I exit the TOS program, shouldn't STalker empty the buffer and RS232ENC tell the modem that it's ok to continue?

Also, should I be using Serial Patch instead of RS232ENC? I've had no other problems with RS232ENC, but experience some a long time ago when I tried Serial Patch.

Any comments? suggestions? Thanks!

You might point him in the direction of ST Applications magazine, then
since I think they have an article on DMA read/write in this months
edition.

4815. Where not to use in the UK

Newsgroup: comp.sys.atari.st
Date: 1993-03-31 11:04:56 UTC
From: craig@hadrian.uk.sun.com
Message-ID: <1pbtsoINN6b5@uk-news.uk.sun.com>
Source record: 207828

Please, please, please don't ever use The First Computer Centre in Leeds. After an 8 week saga I still haven't got a working DOS Coprocessor from them.

Way back in the beginning of Feb 93 I ordered (by Credit Card) a PC Speed C-16, Seven working days later it had not arrived. I contacted First Computers and they told me to ring dispatch and they said it should be with me any day.

2 1/2 weeks later, still no board. Contacted dispatch again and they said "sorry we never sent it. It will be with you in 2 days". 4 days later the board turned up :-), without the manual :-(.

I contacted First again and 7 days later a manual arrived :-), but the software I was using crashed the CO-Processor, PC Ditto worked fine but slowly.

First computers agreed to take back the PC Speed C-16 and sell me a Vortex AT-Once 386-SX for another 70 pounds. :-)

4 days later the Vortex arrived less the system software, the seal was broken on the internal packaging indicating that the board was second hand. I contacted First computers 5 days ago and I'm still waiting for the software. They don't return any of my calls as to why it hasn't arrived, so...

THE FIRST COMPUTER CENTRE in Leeds are a bunch of TOS****S....

Rgds

Craig

PS The real heroes in all this were COMPO computing who sat patiently by the phone with me for several hours whilst I tested my software, even though the board wasn't originally purchased from them.

4816. Euro ST mags

Newsgroup: comp.sys.atari.st
Date: 1993-03-31 11:24:00 UTC
From: Don_Maple@kr.maus.de
Message-ID: <A20345@KR.maus.de>
Source record: 208020

Hi guys!

A quick question for European ST fans. I need to know about ST mags in Europe (except UK and Germany) for an article I'm about to write. There was a mag in France called "Atari magazine" but it seems to have disappeared. The only Dutch mag I know it's still going is the excellent "Atari ST Nieuws".

Anyway, if you'd mail me the list of ST mags in your country I'd really appreciate it. (A few words about the current state of the ST market wouldn't hurt either.) Please send personal mail since my Internet feed is sporadic...

Thanx in advance! If the rest of you are interested I'd be more than happy to post the resulting list.

Don

You could also check out Steinberg's Cubeat and the more recent Cubase Lite.
I use Cubase V2 and it's whole graphical approach to recording and arranging
is sooo easy !!.

>>like "185 K needed to view picture, 120 K available".
>
>That's life: No memory; No big pictures:-)

I ran into a similar problem once - but considering the picture
itself, it was no big surprise. The picture was something like
1024x768x256 and I needed *3* free megs to view it! Of course, considering
the amount of memory necessary just to *view* the picture, I was not surprised.

Since I usually boot up with around 2.5 of my 4megs free, I had to
disable a couple files, but no big deal. Rats, where's those 14meg
Falcons when you need one ? :-)

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...my guess is that on a Falcon, Gemview (or other programs) probably
shouldn't have to use extra memory to convert the picture from
24bit to 8bit (maybe as far as 18bit, but that should still take
less time to convert)...

Try WordPerfect. I use it in TT medium res and it has got a very good spell
checker, not to mention its thesaurus.

4823. Having trouble unarcing...

Newsgroup: comp.sys.atari.st
Date: 1993-03-31 14:12:58 UTC
From: msteve@magnus.acs.ohio-state.edu
Message-ID: <1993Mar31.141258.16218@magnus.acs.ohio-state.edu>
Source record: 208146

I have been having some problems unarcing some software. I especially have
been having trouble with unarcing any file with the .zoo extension.
I have tried to follow the the instructions in the zoo21.ttp, but it keeps on
saying that I am still using bad syntax.

Oh, the program will tell me what is in the arced file, the listing and sizes,
but it won't unarc it. I don't think the program is bad, the archiver or the
list of four programs I have not been able to unarc. Is there a newer updated
version I can get?

I have been trying to unarc the sozobon C programs, but they have the .zoo
extension. What could I be doing wrong that would cause it not to work?

This is how I have been doing this:

1. I copy the file to a blank disk, and then copy the archive program to it.
(I only have a single drive).
2. I open the archive program, and enter the parameters x sozobon.zoo
3. The disk spins, and then the program goes to the help screen. And at the
top shows what the proper syntax is.
4. It will then go back to the windows.

I downloaded the archiver programs back in Mid January that handle .zoo, .lzh,
and .arc from umich. I don't think the program is bad, I probably am making a
major mistake. Any help?

Thanks,
Michael Steve
Columbus OH.

This might be a problem of JPEG-compression itself! Even the smalest JPEG picture may need a huge amount of memory if it is decompressed! Maybe you should think about a memory-upgrade...

4825. ATonce emulator help ..please.

Newsgroup: comp.sys.atari.st
Date: 1993-03-31 14:36:14 UTC
From: cczdvh@unicorn.nott.ac.uk
Message-ID: <1993Mar31.143614.19905@cs.nott.ac.uk>
Source record: 207995

Fellow Net-Atarists.. I have just aquired a 1040Ste that has a ATonce
'286 emulator in it. Unfortunately whenever I try to run ATonce.PRG I get
a message about drive A not resonding. Clearing this runs the emulator (!?)
but when I try to boot from DOS (4.1) the whole shebang crashes or sometimes it
boots but crashes on running anything. I suspect that the original owner
has corrupted the original software disk in some way as I didn't get any
copies and when I try to do an "image" copy of the original disk TOS refuses
with an unclearable "Drive not responding" message, so...

Does anybody know the current *UK (or Europe)* distributors for this product
so I can get a replacement/updated disk. The address in the docs is in Germany,
though the registration card was not filled in, so I sent that off right away
so hopefully I'll be treated as a registered user !??

Replies to the net/mailed *much* appreciated..

>on with their lives. Hmmmm.

That's right. My Mega just kacked a month ago after 6+ years of good
service. I had been toying with the idea of going to a Mac Powerbook,
and use the program MAX for doing my music projects, but it turns out
that the Powerbook has problems with MIDI. I also have so much
invested in the software I have purchased and developed, why start over
just for MAX, which still is a question mark for what I want to do?
The idea of recording 8 digital channels is exciting, if the costs of
the hard disks don't kill me.

Source record: 207952

I've been using Data Diet for about a year now, and I do not have
a hard disk. I use it to cram my boot disk very full, as well as
my spreadsheet disk and word processor disks. It uses a ram disk
as an intermediary. I found out quickly, though, that I needed to
use the immediate mode for compression/decompression since I was
changing floppies in and out. If I used the deferred mode, by
the time it was ready to do its thing, a different floppy was in the
drive; this caused problems. To recap: I use DataDiet and Squish with
just floppies, it works fine, no problems yet. I have not upgraded
to the next version.

4830. Gulam in \AUTO?

Newsgroup: comp.sys.atari.st
Date: 1993-03-31 15:30:59 UTC
From: andy@ice.stx.com
Message-ID: <C4rF3r.J0@skates.gsfc.nasa.gov>
Source record: 207965

Quick, possibly stupid question: how can I run Gulam at boot in the AUTO folder and get into *medium* res mode? It all works fine but comes up in low-res. Yes, I saved a medium-res desktop to that disk, but it seems like the desktop preferences don't get read until AFTER all the AUTO programs are run, so I have to exit from Gulam and then get back into it to get medium-res...

FWIW, my system is a 520ST+, TOS 1.4 in ROM, two external 720K disks...
Also, I'm using the EDISK RAM disk as the very first AUTO program...

Thanks in advance for any suggestions...

Hey, nobody's a PERFECT speller. Sorry if you took offense to a typo.
COuldn't find anything else to grip about?

> If we heard about every time a company was late
> paying its bills, we wouldn't have time for much else!

You wouldn't see Motorola releasing a statement says they were loosing money
becauase of Apple! And don't forget what Jack says, Buisness is war.

> Before
> giving us your expert financial opinion of Atari, how about filling
> us in on things like the SCF, profit ratios, and the IS?

LIke I said, industry people are saying that Atari has NO MONEY. Therefore
they can't pay people or release cmputers. I HOPE they are wrong. But Due to
the track record of ALL computer companies these days, I would find that
difficult to believe.

PackBits Compression Algorithm

Introductory Information
----
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special

information there (most notably Art Studio).

The Formats

<NEOchrome> *.NEO

1 word flag byte [always 0]
1 word resolution [0 = low res, 1 = medium res, 2 = high res]
16 words palette
12 bytes filename [usually " . "]
1 word color animation limits. High bit (bit 15) set if color
animation data is valid. Low byte contains color animation
limits (4 most significant bits are left/lower limit,
4 least significant bits are right/upper limit).
1 word color animation speed and direction. High bit (bit 15) set
if animation is on. Low order byte is # vblanks per step.
If negative, scroll is left (decreasing). Number of vblanks
between cycles is |x| - 1
1 word # of color steps (as defined in previous word) to display
picture before going to the next. (For use in slide shows)
1 word image X offset [unused, always 0]
1 word image Y offset [unused, always 0]
1 word image width [unused, always 320]

4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)
-----------
< 32066 bytes total

Compression Scheme:

PackBits compression is used (see below). Each scan line is compressed
separately; i.e., all data for a given scan line appears before any data
for the next scan line. The scan lines are specified from top to bottom
```

(i.e., 0 is first). For each scan line, all the data for a given bit plane appears before any data for the next higher order bit plane. Note that this is identical to the IFF 'BODY' image data.
To clarify: The first data in the file will be the data for the lowest order bit plane of scan line zero, followed by the data for the next higher order bit plane of scan line zero, etc., until all bit planes have been specified for scan line zero. The next data in the file will be the data for the lowest order bit plane of scan line one, followed by the data for the next higher order bit plane of scan line one, etc., until all bit planes have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on compressed DEGAS files:

o Elite uses a 40-byte buffer to store data being decompressed.

o Whenever a control command is encountered, bytes are stuffed in this buffer.

o The buffer is only emptied when there are EXACTLY 40 characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40 bytes in it. In other words, all control commands must end on or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus error when the picture is loaded.

<Tiny> *.TNY (any resolution)
*.TN1 (low resolution)
*.TN2 (medium resolution)
*.TN3 (high resolution)

Several people have reported sightings of mutated Tiny pictures that do not follow the standard format, so let's be careful out there. What is described here is the format that David Mumper's original TNYSTUFF.PRG produces.

1 byte resolution (same as NEO, but +3 indicates rotation information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits hold left (start) limit; low 4 bits hold right (end) limit
1 byte direction and speed of color animation (negative value indicates left, positive indicates right, absolute value is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead, the
data is divided into four sets of vertical columns. (This results in
better compression.) A column consists of one specific word taken
from each scan line, going from top to bottom. For example, column 1
consists of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
The columns appear in the following order:

1st set contains columns 1, 5, 9, 13, ..., 69, 73, 77 in order
2nd set contains columns 2, 6, 10, 14, ..., 70, 74, 78 in order
3rd set contains columns 3, 7, 11, 15, ..., 71, 75, 79 in order
4th set contains columns 4, 8, 12, 16, ..., 72, 76, 80 in order

Note that Tiny partitions the screen this way regardless of resolution; i.e.,
these aren't bitplanes. For example, medium resoltion only has two bitplanes,
but Tiny still divides medium resolution pictures into four parts.

<Spectrum 512> *.SPU

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

Note that the Spectrum 512 mode's three palette changes per scan
line allow more colors on the screen than normally possible, but a
tremendous amount of CPU time is required to maintain the image.

The Spectrum format specifies a palette of 48 colors for each scan line.
To decode a Spectrum picture, one must be know which of these 48 colors
are in effect for a given horizontal pixel position.

Given an x-coordinate (from 0 to 319) and a color index (from 0 to 15),
the following C function will return the proper index into the Spectrum
palette (from 0 to 47):

```
/*
* Given an x-coordinate and a color index, returns the corresponding
* Spectrum palette index.
*
* by Steve Belczyk; placed in the public domain December, 1990.
*/
int
FindIndex(x, c)
int x, c;
{
int x1;

x1 = 10 * c;

if (1 & c) /* If c is odd */
x1 = x1 - 5;
else /* If c is even */
x1 = x1 + 1;

if (x >= x1 && x < x1 + 160)
c = c + 16;
else if (x >= x1 + 160)
c = c + 32;

return c;
}
```

<Spectrum 512 (Compressed)> *.SPC

```
1 word flag word [$5350 or "SP"]
1 word reserved for future use [always 0]
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map
--------------
<= 50014 bytes total
```

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to DEGAS compressed and Tiny. The data map is stored as a
sequence of records. Each record consists of a header byte followed by
one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= -1 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included). If a palette
entry is not included, it is assumed to be zero (black). The least
significant bit of the bit vector refers to palette entry zero, while the
most significant bit refers to palette entry 15. Bit 15 must be zero,
since Spectrum 512 does not use palette entry 15. Bit 0 should also be
zero, since Spectrum 512 always makes the background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

NOTE: Regarding Spectrum pictures, Shamus McBride reports the following:

"... [The Picture Formats List] says bit 15 of the color map vector
must be zero. I've encountered quite a few files where [bit 15] is
set (with no associated palette entry)..."

<Spectrum 512 (Smooshed)> *.SPS

This format compresses Spectrum 512 pictures better than the standard
method. There are at least two programs that support this format, SPSLIDEX
and ANISPEC, although the two seem to differ slightly in their interpretation
of the format.
One point of interest: Shamus McBride deciphered this format without an ST!

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= ? bytes compressed data bit map
<= ? bytes compressed color bit map

< ? bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to that used in Spectrum Compressed (*.SPC) pictures.

The data map is stored as a sequence of records. Each record consists of a header byte followed by one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x (unsigned):

0 <= x <= 127 Use the next byte x + 3 times
128 <= x <= 255 Use the next x - 128 + 1 bytes literally
(no repetition)

There are two kinds of *.SPS files.

The data may appear in the same order as *.SPC files (SPSLIDEX format?):

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

The second variant (ANISPEC format?) encodes the data as byte wide vertical strips:

Picture data, bit plane 0, scan line 1, columns 0 - 7.
Picture data, bit plane 0, scan line 2, columns 0 - 7.
Picture data, bit plane 0, scan line 3, columns 0 - 7.
. . .
Picture data, bit plane 0, scan line 199, columns 0 - 7.
Picture data, bit plane 0, scan line 1, columns 8 - 15.
Picture data, bit plane 0, scan line 2, columns 8 - 15.
. . .
Picture data, bit plane 0, scan line 199, columns 312 - 319.
Picture data, bit plane 1, scan line 1, columns 0 - 7.
. . .
Picture data, bit plane 3, scan line 198, columns 312 - 319
Picture data, bit plane 3, scan line 199, columns 312 - 319.

A for loop to process that data would look like

```
for (plane = 0; plane < 4; plane++)
for (x = 0; x < 320; x += 8)
for (y = 1; y < 200; y++)
for (x1 = 0; x1 < 8; x1++)
image[y, x + x1] = ...
```

Color map compression:

Color map compression is similar to *.SPC color map compression, but the map is compressed as a string of bits, rather than words. There are 597 records (one for each palette). Each record is composed of a 14-bit header followed by a number of 9-bit palette entries. The 14-bit header specifies which palette entries follow (1 = included, 0 = not included). The most significant bit of the header refers to palette entry 1, while the least significant bit refers to palette 14. Palette entries 0 and 15 are forced to black (zero). Each palette entry is encoded as "rrrgggbbb".

The format of the palette is described above in the section on uncompressed
Spectrum pictures (*.SPU).

<Art Director> *.ART (low resolution only)

16000 words picture data (screen memory)
16 words palette
15 * 16 words 15 more palettes for animation

32512 bytes total

<C.O.L.R. Object Editor Mural> *.MUR (low resolution only)

16000 words picture data (screen memory)
(palettes are stored in separate files)

32000 bytes total

<Doodle> *.DOO (high resolution only)

16000 words picture data (screen memory)

32000 bytes total

<Cyber Paint Sequence> *.SEQ (low resolution only)

This format, while fairly complex, yields excellent compression of animated
images while offering reasonably fast decompression times.

1 word magic number [$FEDB or $FEDC]
1 word version number
1 long number of frames
1 word speed (high byte is vblanks per frame)
118 bytes reserved
----
128 bytes total for .SEQ header

1 byte operation [0 = copy, 1 = exclusive or]
1 byte storage method [0 = uncompressed, 1 = compressed]

1 long length of data in bytes (if the data is compressed, this
will be the size of the compressed data BEFORE decompression)
60 bytes reserved
----
128 bytes total for frame header

? bytes data
}

Frames are "delta-compressed," meaning that only the changes from one
frame to the next are stored. On the ST, .SEQ files are always full-screen
low resolution animations, so the sequence resulting from expanding all the
data will be n 320 by 200 pixel low resolution screens, where n is given in
the .SEQ header.

Since only the changes from frame to frame are stored, image data for a
frame will rarely be 320x200 (except for the very first frame, which will
always be a full screen). Instead what is stored is the smallest rectangular
region on the screen that contains all the changes from the previous frame to
the current frame. The x offset and y offset in the frame header determine
where the upper left corner of the "change box" lies, and the width and height
specify the box's size.

Additionally, each "change box" is stored in one of five ways. For each
of these, the screen is assumed to have the full-screen image from the last
frame on it.

o uncompressed copy: The data for this frame is uncompressed image data,
and is simply copied onto the screen at position (x, y) specified
in the frame header.

o uncompressed eor: The data for this frame is exclusive or'ed with the
screen at position (x, y).

o compressed copy: The data for this frame must be decompressed (see
below), and then copied onto the screen at position (x, y) specified
in the frame header.

o compressed eor: The data for this frame must be decompressed (see
below), and then exclusive or'ed with the screen RAM at position (x, y).

o null frame: The width and/or height of this frame is 0, so this
frame is the same as the previous frame.

Of the 5 methods above, the one that results in the smallest amount
of data being stored for a particular is used for that frame.

Compression Scheme:

Compression is similar to that employed by Tiny, but is not quite as
space-efficient.

Control word meanings:

For a given control word, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 32767).
x > 0 Specifies the number of times to repeat the next word
taken from the data section (from 1 to 32767).

Note that a control word of 0 is possible but meaningless.

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead the four
bitplanes are separated, and the data within each bitplane is presented
vertically instead of horizontally. (This results in better compression.)

To clarify, data for a full screen would appear in the following order:

bitplane 0, word 0, scanline 0
bitplane 0, word 0, scanline 1
...
bitplane 0, word 0, scanline 199
bitplane 0, word 1, scanline 0
bitplane 0, word 1, scanline 1
...
bitplane 0, word 1, scanline 199
...
bitplane 0, word 79, scanline 199
bitplane 1, word 0, scanline 0
...
bitplane 3, word 79, scanline 199

Note however, that the data does not usually refer to an entire screen, but
rather to the smaller "change box," whose size is given in the frame header.

<Animatic Film> *.FLM (low resolution only)

1 word number of frames
16 words palette
1 word speed (0 - 99; value is 99 - # vblanks to delay between frames)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse (change direction)
1 word width of film in pixels
1 word height of film in pixels
1 word Animatic version number (major) [< 2]
1 word Animatic version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved for expansion (should be all zeros)
----
32 words total for header

? words image data (words of screen memory) for each frame, in order

<Animaster Sprite Bank> *.ASB (low resolution only)

```
1 word number of frames - 1
1 word ?
1 byte maximum width, in pixels
1 byte maximum height, in pixels
16 words palette
--------
38 bytes total for header

For each frame {
1 word width of this frame (in pixels) - 1
1 word height of this frame (in pixels) - 1
1 word ?
? words image data (words of screen memory)
}

<STOS> *.MBK

9 words ?
1 long $19861987 (magic number?)
1 long offset from this long to header for low resolution
parameter block (if past end of file, no low res frames)
1 long offset from this long to header for med resolution
parameter block (if past end of file, no med res frames)
1 long offset from this long to header for high resolution
parameter block (if past end of file, no high res frames)
1 word number of low resolution frames
1 word number of medium resolution frames
1 word number of high resolution frames

For each frame {
1 long offset to data (probably only used internally by STOS)
1 byte width in words (multiply by 16 to get width in pixels)
1 byte height in pixels
1 byte X hotspot location
1 byte Y hotspot location
}

(The format implies other stuff could be here.)

1 long ["PALT" $50414C54]
16 words palette

? words of data for each frame, in the order mentioned in the
header. Monoplanar mask data follows image data for each frame.
----------
? words total

The frames often seem to be in semi-random order, not necessarily in
the order they are to be animated.

<GEM Bit Image> *.IMG

1 word version number of image file [1]
1 word length of header in words [usually 8]
```

1 word number of color planes [1 for monochrome]
1 word pattern length in bytes [1-8, usually 2 for screen images]
1 word pixel width in microns (1/1000 mm, 25400 microns per inch)
1 word pixel height in microns
1 word line width in pixels
1 word number of lines

? words header length defined in 2nd word of header

? bytes data

NOTES: If the image is a color image (planes > 1), the planes are stored separately starting with plane 0. There is, however, no standard way of storing the color palette. Some programs may save the palette in separate files, some may extend the header. For this reason, you should never assume the header is 8 words long, always get the header length from the 2nd word of the header. Also, the line width in the 7th word is the number of pixels in a line. Since the data is encoded in byte-wide packets, the actual unpacked line width is always a multiple of 8, and may be 1-7 pixels longer than the length specified in the header.

For each byte x in the data section,

x = 0 Pattern/scanline run.
Read the next byte, n (unsigned).

If n > 0 then:
Read a number of bytes equal to the "pattern length" word in the header. Repeat this pattern n times.

If n = 0 then:
Scanline run. Data for the next scanline is to be used multiple times. Read the following record:

1 byte flag byte [$FF]
1 byte number of times to use next scanline data

The data for the next scanline follows, compressed normally.

x = 80 (hex) Uncompressed bit string. The next byte determines the number of bytes to use literally. The literal data bytes follow.

otherwise Solid run. The value of x determines what to draw. The high bit specifies whether the pixels are set or cleared. A 1 indicates a byte-run using $FF, a 0 indicates a byte-run using $00. The low 7 bits, taken as an unsigned quantity, specify the length of the run in bytes.

<GEM Metafile> *.GEM

Marcel Boom <mboom@mswe.dnet.ms.philips.nl> recently sent me this
format description. I have reproduced it here, largely unchanged.

The file consists out of a header and the data records. The header has
the following format:

word mf_header: should be -1, which indicates a metafile
word mf_hlength: The length of the header part (usually 24 words)
word mf_version: Version number (usually 101)
word mf_ndcrcfl: 0: NDC coordinates, 2: Raster coordinates
word mf_extends1: Optional, minimal used x coordinate
word mf_extends2: Optional, minimal used y coordinate
word mf_extends3: Optional, maximal used x coordinate
word mf_extends4: Optional, maximal used y coordinate
word mf_width: Optional, page width in 0.1 mm
word mf_height: Optional, page height in 0.1 mm
word mf_coords1: Optional, coordinate system param 1
word mf_coords2: Optional, coordinate system param 2
word mf_coords3: Optional, coordinate system param 3
word mf_coords4: Optional, coordinate system param 4
word mf_imgflag: 0: No images, 1 contains bit images
word mf_reserved1: reserved.
.
.
word mf_reserved9: reserved.

After the header follows the data records of the following format:

word 0: VDI command number
word 1: n: Number of parameters for ptsin array
word 2: m: Number of parameters for intin array
word 3: Subopcode
word 4 to 4+n: ptsin array
word 4+n to 4+n+m: intin array

A VDI command number of -1 signals the end of file.

VDI command numbers:
5: Escape functions:
Subopcode:
1: Inquire addressable character cells
2: Exit alpha mode
3: Enter alpha mode
20: Form advance
21: Output window
22: Clear display list
23: Output bit image file
98: Update metafile extents
99: Write metafile item
100: Change GEM VDI filename
6: Polyline

7: Polymarker
8: Text
9: Filled area
11: GDP:
subopcode:
1: Bar
2: Arc
3: Pie
4: Circle
5: Ellipse
6: Elliptical arc
7: Elliptical Pie
8: Rounded rectangle
9: Filled rounded rectangle
10: Jutified graphic text
12: Set character height, absolute mode
13: Set character baseline vector
14: Set color representation
15: Set polyline linetype
16: Set polyline line width
17: Set polyline color index
18: Set polymarker type
19: Set polymarker height
20: Set polymarker color index
21: Set text face
22: Set graphic text color index
23: Set fill interior style
24: Set fill style index
25: Set fill color index
26: Inquire color representation
32: Set writing mode
35: Inquire current polyline attributes
36: Inquire current polymarker attributes
37: Inquire current fill area attributes
38: Inquire current graphic text attributes
39: Set graphic text allignment
102: Extended inquire function
103: Countour fill
104: Set fill perimeter visibility
106: Set graphic text special effects
107: Set character cell height, points mode
108: Set polyline end styles
112: Set user defines fill pattern
113: Set user defined line style pattern
114: Fill rectangle
117: Inquire character cell width
129: Set clipping rectangle
131: Inquire current face information

The meaning of the arrays can be found in the several GEM programming books.

NOTE: The word qualifier is not the Motorola word, but the Intel word,
so high and low byte are swapped!

<STAD> *.PAC (high resolution only)

4 bytes "pM86" (vertically packed) or "pM85" (horizontally packed)
1 byte id byte
1 byte pack byte (most frequently occuring byte in bitmap)
1 byte "special" byte
----
7 bytes total for header

? bytes data

The data is encoded as follows. For each byte x in the data section:

x = id byte Read one more byte, n. Use pack byte
n + 1 times.
x = "special" byte Read two more bytes, d, and n (in order).
Use byte d n times.
otherwise Use byte x literally.

<Imagic Film/Picture> *.IC1 (low resolution)
*.IC2 (medium resolution)
*.IC3 (high resolution)

4 bytes "IMDC"
1 word resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
1 word date (GEMDOS format)
1 word time (GEMDOS format)
8 bytes name of base picture file (for delta compression), or zeroes
1 word length of data (?)
1 long registration number
8 bytes reserved
1 byte compressed? (0 = no, 1 = yes)

If compressed {
1 byte delta-compressed? (-1 = no, > -1 = yes)
1 byte ?
1 byte escape byte
}
----
65 bytes total for header (68 bytes if compressed)

? bytes data

Compressed data may be either stand-alone or delta-compressed (relative
to the base picture named in the header). Delta compression involves
storing only how the picture differs from the base picture (i.e., only
portions of the screen that have changed are stored). This is used to
to encode animated sequences efficiently.

Compressed data, stand-alone:

```
For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 2, use the next byte n times.
If n = 1, keep reading bytes until a
byte k not equal to 1 is encountered.
Then read the next byte d.
If the number of 1 bytes encountered is o,
use d (256 * o + k) times. I.e.,

if (n == 1) {
o = 0;
while (n == 1) {
o++;
n = next byte;
}

k = n;
d = next byte;

Use d (256 * o + k) times.
}
else {
d = next byte;
Use d (n) times.
}

x != escape byte Use x literally.

Compressed data, delta compressed:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 3, use the next byte n times.
If n = 1, do the same as for n = 1 in
stand-alone compression (above).
If n = 2, then set n = next byte.
If n = 0, end of picture.
If n >= 2, take n bytes from base
picture.
If n = 1, do the same as for n = 1
in stand-alone compression (above),
but take (256 * o + k) bytes from
base picture.

x != escape byte Use x literally.

<IFF Format> *.IFF

4 bytes "FORM" (FORM chunk ID)
1 long length of file that follows
4 bytes "ILBM" (InterLeaved BitMap file ID)
```

```
4 bytes "BMHD" (BitMap HeaDer chunk ID)
1 long length of chunk [20]
20 bytes 1 word = image width in pixels
1 word = image height in lines
1 word = image x-offset [usually 0]
1 word = image y-offset [usually 0]
1 byte = # bitplanes
1 byte = mask (0=no, 1=impl., 2=transparent, 3=lasso)
1 byte = compressed [1] or uncompressed [0]
1 byte = unused [0]
1 word = transparent color (for mask=2)
1 byte = x-aspect [5=640x200, 10=320x200/640x400, 20=320x400]
1 byte = y-aspect [11]
1 word = page width (usually the same as image width)
1 word = page height (usually the same as image height)

4 bytes "CMAP" (ColorMAP chunk ID)
1 long length of chunk [3*n where n is the # colors]
3n bytes 3 bytes per RGB color. Each color value is a byte
and the actual color value is left-justified in the
byte such that the most significant bit of the value
is the MSB of the byte. (ie. a color value of 15 ($0F)
is stored as $F0) The bytes are stored in R,G,B order.

4 bytes "CRNG" (Color RaNGe chunk ID)
1 long length of chunk [8]
8 bytes 1 word = reserved [0]
1 word = animation speed (16384 = 60 steps per second)
1 word = active [1] or inactive [0]
1 byte = left/lower color animation limit
1 byte = right/upper color animation limit

4 bytes "CAMG" (Commodore AMiGa viewport mode chunk ID)
1 long length of chunk [4]
1 long viewport mode bits (bit 11 = HAM, bit 3 = interlaced)

4 bytes "BODY" (BODY chunk ID)
1 long length of chunk [# bytes of image data that follow]
? bytes actual image data

NOTES: Some of these chunks may not be present in every IFF file, and may
not be in this order. You should always look for the ID bytes to find a
certain chunk. All chunk IDs are followed by a long value that tells the
size of the chunk (note that "ILBM" is not a chunk ID). This is the number of
bytes that FOLLOW the 4 ID bytes and size longword. The exception to this is
the FORM chunk. The size longword that follows the FORM ID is the size of the
remainder of the file. The FORM chunk must always be the first chunk in an
IFF file.

The R,G,B ranges of AMIGA and ST are different (AMIGA 0...15, ST 0...7),
as is the maximum number of bitplanes (AMIGA: 5, ST: 4).

Format of body data
```

An expanded picture is simply a bitmap. The packing method is PackBits
(see below), and is identical to MacPaint and DEGAS Elite compressed.

The (decompressed) body data appears in the following order:

```
line 1 plane 0 ... line 1 plane 1 ... ... line 1 plane m
[line 1 mask (if appropriate)]
line 2 plane 0 ... line 2 plane 1 ... ... line 2 plane m
[line 2 mask (if appropriate)]
...
line x plane 0 ... line x plane 1 ... ... line x plane m
[line x mask (if appropriate)]
```

The FORM chunk identifies the type of data:

```
"ILBM" = interleaved bit map
"8SVX" = 8-bit sample voice
"SMUS" = simple music score
"FTXT" = formatted text (Amiga)
```

<MacPaint> *.MAC

```
1 long version number [0=ignore header, 2=header valid]
38 * 8 bytes 8x8 brush/fill patterns. Each byte is a pattern row,
and the bytes map the pattern rows top to bottom. The
patterns are stored in the order they appear at the bottom
of the MacPaint screen top to bottom, left to right.
204 bytes unused
-------------
512 bytes total for header

< 51200 bytes compressed bitmap data
-------------
< 51712 bytes total
```

NOTE: The version number is actually a flag to MacPaint to indicate if
the brush/fill patterns are present in the file. If the version is 0,
the default patterns are used. Therefore you can simply save a MacPaint
file by writing a blank header (512 $00 bytes), followed by the packed
image data.

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image.
The packing method is PackBits (see below). There are 72 bytes per
scan line. Each bit represents one pixel; 0 = white, 1 = black.

<RGB Intermediate Format> *.RGB (low resolution only)

This format was invented by Lars Michael to facilitate conversions between
standard ST picture formats and higher resolution formats like GIF and IFF.
It supports 12 bits of color resolution by keeping the red, green and blue
components in separate bit planes.

1 word resolution (ignored)
16 word palette (ignored)
16000 words red plane (screen memory)
1 word resolution (ignored)
16 word palette (ignored)
16000 words green plane (screen memory)
1 word resolution (ignored)
16 word palette (ignored)
16000 words blue plane (screen memory)

96102 bytes total

The format was derived by concatenating three DEGAS .PI1 files together --
one for each color gun. The RGB value for a pixel is constructed by looking
at the appropriate pixel in the red plane, green plane, and blue plane. The
bitplanes are in standard ST low resolution screen RAM format, but where pixel
values in screen RAM refer to palette entries (0 through 15), pixel values
here correspond to absolute R, G, and B values. The red, green, and blue
components for each pixel range from 0 to 15 (4 bits), yielding a total of
12 bits of color information per pixel. Not coincidentally, this is exactly
the format of ST palette entries (although on ST's without the extended
palette only the lower 3 bits of each color component are used).

You can view a single bit plane on a standard ST by splitting the .RGB file
into its three DEGAS .PI1 components and setting the palette to successively
brighter shades of gray.

<ComputerEyes Raw Data Format> *.CE1 (low resolution)
*.CE2 (medium resolution)

1 long [$45594553 or "EYES"]
1 word resolution [0 = low res, 1 = medium res]
8 words ?
If resolution = 0 {
64000 bytes red plane, 320 x 200, 1 pixel per byte
64000 bytes green plane, 320 x 200, 1 pixel per byte
64000 bytes blue plane, 320 x 200, 1 pixel per byte

192022 bytes total
}
else If resolution = 1 {
128000 words 640 x 200, 1 pixel per word

256022 bytes total
}

This is almost two formats in one:

Low resolution:

The planes are arranged vertically, instead of horizontally.
The first byte is the red component of pixel (0,0), the second is (0,1),
and the third (0,2). The 201st corresponds to (1,0), etc. The 64001st

byte is the green component of (0,0).
Only the low six bits of each byte are used.

Medium resolution:

The picture is arranged vertically, instead of horizontally.
The first word is pixel (0,0), the second is (0,1), and the third
(0,2). The 200th is (1,0) etc.
Each word is divided up into the RGB values for the corresponding
pixel, as follows:

```
Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 B4 B3 B2 B1 B0 G4 G3 G2 G1 G0 R4 R3 R2 R1 R0
```

Bit 15 is not used.

<PackBits Compression Algorithm>

The following packing algorithm originated on the Mac, was adopted by
Electronic Arts/Commodore for use in the IFF standard, and then by Tom
Hudson for use in DEGAS Elite. The algorithm is currently used in
MacPaint, IFF, and DEGAS Elite compressed file formats. Each scan line
is packed separately, and packing never extends beyond a scan line.

For a given control byte 'n':
0 <= n <= 127 : use the next n + 1 bytes literally (no repetition).
-127 <= n <= -1 : use the next byte -n + 1 times.
n = -128 : no operation, not used.

---

* Roland Waldi contributed extensive information on the following formats:

GEM, IMG, Doodle, STAD, Imagic Film/Picture, Art Director, IFF

** John Brochu, ST picture formats guru, provided sage advice and many
corrections to the following formats:

NeoChrome, DEGAS Elite Compressed, Spectrum 512 Compressed,
GEM Bit Image, IFF, MacPaint

Version of.....Wed Mar 31 12:17:26 EST 1993
(Last change: GEM format decription added)

4835. Adding Memory to a Stacy 2

Newsgroup: comp.sys.atari.st
Date: 1993-03-31 18:22:31 UTC
From: dgaxiola@m11-116-8
Message-ID: <7336021518-317670@m11-116-8>
Source record: 207956

Hi everyone,

I've decided that 2 Megs of memory in my Stacy 2 just isn't enough anymore and decided to take advantage of the small compartment on the bottom that allows for memory to be added. It appears that it can take 2 1Megx8 SIPP modules. Fine, however upon going to and calling some local computer stores, they don't seem to have heard of 1Megx8 SIPPs, only 1Megx9 SIPPs. Does anyone know where I can get ahold of these SIPPs? Through mail order perhaps?

Thanks,
--David Gaxiola

I heard that although Atari are experiencing a drop in sales they have a fair
amount of liquid cash, making them well placed (financially) to release what
will ultimately be there life saving machines (ie. Falcon and Jaguar ranges).

I would appreciate it if you don't imply that I am out of my mind.
I will be getting a Falcon without a monitor because I can't afford one.

I think you'll find that a T.V. is quite good at displaying true colour video
images.
An expensive DSP computer is also quite good at handling sound, I'm sure your
NEC 3D Multisync is not going to be of much use in that department (certainly
ain't as good as my hifi).

I have a pricelist from Pams here, they offer Novell-Netware
compatibility for PamsNet for DM 502.37 (incl. VAT). To me, this
seems to mean that it is pollible to integrate an ST into a
Novell network using a PamsNet ethernet adapter for approx. DM
1700, and the PamsNet Novell compatibility software mentioned
above.
From my experience, I can say that PamsNet works fine, but we
don't have the Novell compatibility stuff here, so I can't
comment on that.

F O R I M M E D I A T E R E L E A S E

MICHAEL A. BANKS BEGINS "THE INSIDE LINE" COLUMN FOR CONNECT MAGAZINE

ANN ARBOR, Michigan (March 24, 1993) -- Pegasus Press today announced the addition of Michael A. Banks as an editorial staff columnist for CONNECT magazine.

With literally thousands of book and magazine article credits to his name, Michael Banks is recognized as one of the premiere authors in the computer industry. He has authored such books as DELPHI: The Official Guide (Brady Books/Simon & Schuster), The Modem Reference (Brady Books/Simon & Schuster), Understanding FAX and E-mail (Howard W. Sams & Co.), Portable Communications (Brady Books/Simon & Schuster), and Laptop Power (Brady Books/Simon & Schuster), as well as co-authored Pournelle's PC Communications Bible (with Jerry Pournelle, published by Microsoft Press).

In a new column for CONNECT called "The Inside Line," Michael Banks voices his opinions and shares with readers his unique viewpoint on the online world of telecomputing. "I'll be more outspoken," says Banks, "and, depending on the reader, more controversial in this new column than the majority of computer magazine publications allow."

Along with fast facts, useful news and information, Banks will bring readers the truth about what's available online, changes in the online world, why things are as they are online, and what's happening behind the

scenes. "I'm going to shoot from the hip, but with accuracy," Banks said.

Banks promises his column will deliver some fascinating opinions and extrapolations, all delivered in the style hundreds of thousands of computer users have enjoyed in his books and other publications.

The first installment of "The Inside Line" will appear in the July/August issue of CONNECT, which will be available on newsstand and bookstore shelves in June.

"We feel Michael is an excellent complement to CONNECT's current line-up of columnists and authors," says Patricia Snyder-Rayl, managing editor for CONNECT. "Michael's style of writing and ability to explain cutting-edge technology in easy to understand terms is exactly what we want readers to find in CONNECT."

CONNECT is a bi-monthly magazine covering the major commercial online services (such as CompuServe, America Online, GEnie, Delphi and BIX), the Internet and bulletin board system networks (such as Fidonet and RIME). The publication is available from newsstands and bookstores everywhere.

4842. CeBIT GFA news

Newsgroup: comp.sys.atari.st
Date: 1993-03-31 19:08:49 UTC
From: aeg03@rrz.uni-koeln.de
Message-ID: <1pcq81INN22ct@rs1.rrz.Uni-Koeln.DE>
Source record: 207961

Hello net folks,

at the CeBIT I talked to Mr. Richter, the boss of the company
that develops GFA basic now. He said the following:
* The GFA basic 4.0 interpreter will become available in the next
few weeks. The compiler will be ready in summer (if I recall that
correctly).
* The whole thing was written completely new. They looked at the
old sources and decided it was not worth the effort to try to
debug that stuff.
* The compiler will be done based on the GNU compiler. Therefore,
GFA users will take advantage of the GNU compilers high
performance optimization, plus they can configure and even re-
hack everything, as the compiler is made available according to
the GPL conditions.
* There are documented ways for users to configure and extend the
GFA system -- no more hacking and patching of the interpreter.

As for demos, I saw the interpreter running on a TT with a TTM195
monitor. I could only get a superficial impression of it, and had
no chance to play with it myself, but it looked nice to me thus
far. The editor is fully GEM, several sources can be edited in
different windows, and there is an online-help system. Mr.
Richter emphasized that all the old editing functions are still
the same, e.g. the F-keys will do the same as in the current GFA
versions. He explained that they have two phases in development:
Firstly, to establish a clean GFA system that is fully compatible
to GFA basic 3.6, and secondly to expand the language's
capabilities.

There's a slogan in there somewhere, I just know it.

The spirit of your post was right on the money IMO, though I don't
necessarily agree with all the details. There are people who have
been moaning and complaining about Atari since the ST was released in
1985, people who insist on comparing their machine to all those other
evil computers out there and defending it's honor against all comers.
And then there are people who've owned and used their ST, Mega ST, or
whatever, and have had fun, been productive, and generally gotten
on with their lives. Hmmmm.

I wonder if you are using a reset proof ram disk and are only reseting the machine? You might want to make sure you do a cold reboot (or power cycle the machine) to insure that the ram disk has been reset.

Bob

Mark Santora (yeah, YOU):

Okay, so the Motorola spelling comment was a cheap shot on my part-
I'll take that, but I had plenty of other things to gripe
about: basically your sweeping statements without supporting facts.
Care to elaborate on your stock-price prediction?

Okay, if you can't give us financial figures, how about naming (or better,
quoting) these "industry people"? Yes, I hope "they" are wrong, too.

From a financial analysis point of view, it would be difficult to generalize
across this entire industry, especially as a wide variety of markets
are being served. So, how "ALL computer companies" are doing would
have to be examined a little more closely.

In article <C4pyro.1Ew@sdf.lonestar.org> evanlang@sdf.lonestar.org (Evan Langlois) writes:
I realize you may be somewhat biased against my software but there's no
reason to post complete lies. Your posting is full of them:

>Yep, same guy that wrote the Xformer and then complained when new TOS versions
>and the STe came out. Seems he didn't like atari upgrading hardware because it
>made it harder for his emulator to work.

Funny, the last version of Xformer was released before the STE and TOS 2.06
ever existed! It runs just fine on them too. It's the TT I complained
about due to its lack of compatibility with a lot of ST software, including
Xformer. About 2 years ago I did modify Xformer to run on the TT and I
would assume that version would also run on the Falcon now. Just to make
sure I just booted up Gemulator under TOS 2.06 and ran ST Xformer. No
problems with TOS 2.06. Darn.

By the way, in 1990 when the STe was released in the U.S. I reviewed it
in ST Informer and actually gave it a very positive review. Later on I
co-developed a sound sampling cartridge and DSP software for the STe which
I used to earn two credits in college. I _LIKE_ the STe. I _LIKE_ TOS 2.06
(that's why I bundle it with Gemulator, and not TOS 1.0 or TOS 1.4). I
HATE the TT. Ok? Got that? Now you can spread correct rumors.

> GEMulator needs a 486/25 at 8MB RAM to emulate an
>8mHz ST, to emulate a MegaSTE you need at least a 486/50 and graphics and
>register operations are still FAR below what they should be. And that is DOS
>speeds. Under Windows is VERY slow. And it costs about $400 for the thing
>too.

I realize the education system in Texas is below par, but I didn't realize
it produced illiterates. Had you simply read a posting someone made a few
days ago, or bothered to open up any recent issue of ST Informer or Current
Notes where Gemulator is advertised, you'd know the list price of the
complete package (board, TOS 2.06 ROMs, software) is $229. $179 if you
supply your own ROMs. $229 != $400 by my math.

The 8 meg of RAM statement is false. It's 4 meg. Don't be whining about
how 4 meg of RAM on a PC is so much when many STs have that much RAM too.
Speed under Windows is about 10% slower than under DOS. I didn't realize
that a 10% slowdown was considered "VERY slow". You speak a different language.

As for the graphics being "below what they should be", what does that mean?
Gemulator emulates the 3 standard ST graphics modes, as well as giving
you access to VGA and Super VGA graphics modes (640x480 and 800x600 16 color
modes). Really nice for desktop publishing which I believe is one of the
main reasons people buy the ST. Too bad the real ST has the worst graphics

capabilities of any computer on the market! Unless you shell >$400 for one of those graphics card updates which is really nothing more than a VGA card interfaced to an ST.

>I can 2 1040STEs for that price! Or I can get a 1040STE with 4MB AJAX
>upgrade, and TOS 2.06 and have some money left over. Or maybe I could find a
>used MegaSTE. The hardware is a card with TOS versions on it. The software
>is shareware. I'd like to take a look at the software and see if it would
>work with a boot-TOS. Maybe I could dump my TOS 1.62 ROMs to disk to see if
>his software works. No way am I gonna pay $400 on hardware to see if the
>software works.

First things first: Gemulator is not shareware. It's a $229 commerical product. There was a shareware version of it released which by itself functioned as a 68000 emulator only but that version is no longer available.

Next: Gemulator does allow you to plug in _any_ set of ST TOS ROMs, which means TOS 1.0, TOS 1.2, TOS 1.4, TOS 1.6, TOS 1.62, and TOS 2.06, as well as disk based TOS 1.0 that originally shipped with the 520 ST. Dumping your TOS 1.62 ROMs to disk won't work any more than it will on a real ST. Wise up moron. But you will find that _plugging them in_ to the board will work. oooh.

Finally, you don't have to pay $400 to try it. If you're happy with your 2 STEs (gee, I didn't know that for $400 you could also get monitors and hard disks for two systems, wow, cheap!) then fine, STICK WITH IT!!!!! There is no one holding a gun to your head to buy Gemulator. It is a product for people that use both STs and PCs, just like products like Supercharger and AT Speed are meant for those type of people. If you're not into PCs, you probably don't need Gemulator. One day in the future you may own a PC, so keep it in mind.

But again, if you are interested in finding out if the product works (I don't know why, you don't strike me as the type who is interested in using it), you could simply open your eyes and _read_. There have been postings here to the net from people who use Gemulator every day and will verify that yes, it does work as advertised. There are also several magazine articles in ST Informer and Current Notes and Atari User that confirm that yes, Gemulator has been shown to the public numerous times (last year's Glendale and WAACE shows to name a few) and yes, it was seen working, doing things like running Calamus SL in Super VGA mode under Windows.

From what I've been told by the editorial staff, Current Notes will be printing a review of Gemulator in their April issue. They ran a "preview" of it last year before it was released and a lot of things about it have been inmproved since then. No, I do not know what the article says, and no, the person doing the review was not given a free copy. He went out and purchased it on his own from me at the WAACE show last year after seeing it demonstrated there.

There is always the concept of purchasing it, trying it, and if you're not happy with it, asking for your money back. Ooooh, what a concept. I invite

you to do that in fact. At least it will (hopefully) educate you somewhat so
next time you go to post a message to the net it can contain some actual truth.

This is my BIG moan about ZOO, it no good for people with 520k machines and
single drive, I wish these chaps that run these archives sites would convert
over to a better archiving format, at present ZIP would fit this bill..

NOTE: we are all not Unix freeks, and for the average user ZOO is far to hard.

Slow down! You don't WANT to know the address. Just use the XBIOS
routines for setting the colours. Don't know them? Grab the include
files for Mint - it has a very current osbindings and even falcon-specific
bindings. Even an ASM programmer would be able to use the bindings,
since they are in ASM anyway.

I was the poster of the little blurb that started this entire thread, so I think my .02 is ok. I have never compared my system to any other on this net. OK, so I tlak with some amigoids back home. I also have gotten almost six years worth of entertainment from my MEGA and have NO intention of getting rid of it. I have also gotten tons of practical use out of my Mega and it still does more than I could ever ask it to for what I use it for.

I would also like to point out that I have tried programs on every system out there and there isn't ONE that comes near to what Calamus SL does. And If Atari folds tomorrow, I will have a MEGA, I WILL buy a TT, and I will use my systems in good health.

BUt while this is all nice, it is important to notice that Jack and Huey, Duey, and Louie have severely f'd up my favorite small computer company. I wish SOMEONE would see the potential for the TOS line of computers other than we the minority of installed users and a few musicians...

Cheering until the day I go away...

4857. For Sale

Newsgroup: comp.sys.atari.st
Date: 1993-04-01 03:22:05 UTC
From: tevans%sunset.cs.utah.edu@cs.utah.edu
Message-ID: <1993Mar31.202206.11631@hellgate.utah.edu>
Source record: 207978

I don't want to sound pessimistic, but I've finally given up on Atari.
Therefore, the following are for sale:

Atari Mega2ST w/4 Megs of RAM upgrade.

Atari SM124 (I think that's the code) Monochrome monitor.

Atari SC1224 Monitor.

Seagate 40 Meg. Hard Disk (In large case, will hold 3 disks).

If you're interested, please make me a reasonable going rate for one or more
of the above items. BTW, with the Mega2 I'll throw in the software I have,
although it's not a lot.

tevans@cs.utah.edu
Home #:(801) 596-0409
Work #:(801) 594-4226

PS: No reasonable rate will be refused, I need the money to invest in another
new computer. Shipping costs are up to you.

>Well, the rumor is Alt.games.lynx is that Atari has dropped the Lynx!!!

That rumor's got no basis in reality. It comes because of speculation passed from one ignorant clerk at a Toys 'R Us store.

The truth is that TRU dropped the Lynx (actually, all Atari stuff) back in December. Hence no more Lynx items at TRU stores. This came because (supposedly) the constant changing of sales managers at Atari proved too trying for Toys 'R Us, Inc., so they dropped Atari to make life simpler.

Lynx materials are still easy to find at video-game-specific stores, such as Babbages and Electronics Boutique.

ICD claims that, but it seems to be impossible to get information *HOW* they do it.

In fact, there is a trick that allows to send command from higher command groups on *all* host adapters (I guess this is what ICD advertises), but this trick (using linked commands) doesn't work with all SCSI devices (notably Quantum's).

4862. A500 & Atari ST

Newsgroup: comp.sys.atari.st
Date: 1993-04-01 06:03:57 UTC

Cross-posted to:
comp.sys.atari.st,comp.sys.amiga,comp.sys.amiga.marketplace,misc.forsale,misc.forsale.computers,misc.forsale.computers.other

Thanks to all those that have sent me email, and some that I wish to contact again (for some strange reason, I haven't heard from them in a while!)

For those who were interested in the A500, it's SOLD! It had 1 Meg and 2.04KS to very briefly summarize what was included to refresh some memories.

I still have the ST for sale if anyone is interested (got a few replies, but only inquiries)

Again, the specs on the machine - 1040ST, 1 Meg ram (why else would they call it a 1040?!), SM124 Monochrome (b&w) monitor, PC Ditto (IBM emulator - software), Magic Sac+ and Translator One (Mac emulator with 64k Mac Roms - runs faster than a Mac 512! Translator One allows reading Mac disks - Hardware), Final Cut (midi software).

I was originally looking for $300 CDN (~$250 US), but I am open to offers on it.

Message-ID: <1993Apr1.100835.27712@jussieu.fr>
Source record: 207984

Atari seems to be OK... So, what are the news about the invisible Falcon 040 ?
Some persons in France say that the Flacon 040 will have a 040 CPU at 32 MHz
frequency with perhaps one DSP (92001) or two (56001), and full 24 bits graphic
mode. It 'seems' to be great !

Perhaps it has been shown during the CeBIT, but hidden, only for devs, only
for their eyes...

4866. The BEST FTP Site..

Newsgroup: comp.sys.atari.st
Date: 1993-04-01 10:44:12 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1peh1sINNhos@golem.wcc.govt.nz>
Source record: 207985

I wish to thank the chaps that run, what I would consider
THE BEST FTP archive site for Atari...

Good on ya Riply and Hesche..

This is ftp.cs.tu-berlin.de 130.149.17.7

1. It allways has the latest suff..
2. It has a good mailer..
3. It has indexs/files for people that only have mail access..
4. Has what is new files.
5. A good commented English index.
6. You get good help from the people that run it..
7. Files are on there with out delay, not like A.A.

So come on you chaps that run rus.uni-stuttgard and tu-clausthal,
you don't have much support for people that only have mail access,
no last 7 day files, or whats new, no commented index, Stuttgard
seems to mainly support German users...

I think I have mailed more files from Berlin than A.A., and its far easyer
to connect to A.A. Than Berlin from here, also Berlin does not drop parts
like A.A. does..

So are there any othere European Site that have support like Berlin,
with good mail support...

How about some feed back on this from other mail users..??

Roger..... sheppard_r@kosmos.wcc.govt.nz

4867. C-Kermit 5A (188)

Newsgroup: comp.sys.atari.st

*** C-Kermit 5A(188) ***

Well any of you that have played with the old Kermit, Uniterm, etc,
should definitively give C-Kermit 5A (188) a try..

File CKER5A.ZOO found on most sites..

Its fast very fast, and its the only protocol
to support wild cards, lets me get all those mailed Uencoded
part files down with out having to worry about there file names..

I had a few finger problems it getting it going, but it now runs
some 100%, I am using the full parser version..

So if your system that you call has C-Kermit 5A, why not give it a try..??

Roger..... sheppard_r@kosmos.wcc.govt.nz

Here is a list of the software mentioned in ATARI's leaflet at the CeBit. A
lot of it certainly also works on ST/TT.

Availability: AV-Now, SO-Soon, DV-under development (but this year),
SE-have seen it with my own eyes at the CeBit (certainly I overlooked
something).

True Color Graphics programs:

Prism Paint: Easy to use. AV

Synthetic Arts: Especially for interlaced and overscan modes. AV

True Paint: Easy to use, small animations, uses SpeedoGDOS. AV

Cranach Paint: Professional. AV

Chagall: Professional. AV,SE

D2M: For any resolution. AV

Meridian: AV

Eclipse Paint: Like Neochrome. SO

Raytraching:

Phoenix: AV

Chloe: DV

InShape: AV,SE

Retouche:

Photo Studio: up to 24 bit. AV

PS Pro: uses DSP. DV

Timix: 32 Bit. DV

Dyna Cadd: for falcon with rendering. AV

Animation:

Autodesk animator: Like on PC. DV

Toki Line Test: with audio. SO

Toki Video: For complete video productions. DV

Morphing Fun machine: Interpolates one picture into another.

DA's vektor: Vektor + Pixel animation. SO,SE

DA's Picture: Photo retouche. DV

Video

Screen Blaster: Up to 1100x800 pixel. AV,SE

Over Genlock: Overlay genlock for titles. AV,SE

Matrix Grabler: True color digitizer. AV,SE

Home Video Kit: True color digitizer, genlock, software. DV

Jri Genlock: titles, software. DV

TC Video digitizer: True color Pal/SVideo real time digitizer. DV

Color Thing: Like Amiga's 24Bit graphics card. DV

Multimedia:

JVC Interface: Connects JVC components like CD, DAT,... DV

Picture Telephone: DV

Microsoft Bookshelf Front-end: DV

Comics Maker: AV

Bit Bopper: Graphics + Sound. AV

Programming Tools:

HiSoft Basic2: AV,SE

DEVPAC 3: AV

Lattice C 5.5: AV

Assembler/Adebug IV: SO,SE

Pure C, Pure Pascal: AV,SE

GFA 4.0: DV

FalcOS: DV

DSP-Moo: object oriented DSP programming. DV

Music & Audio Tools:

D2D Edit: Stereo direct to disk. AV

4T FX: 4 tracks direct to disk. AV

Notator Logic: DV

Cubase Audio: AV,SE

DigiTape: 6 tracks direct to disk. AV,SE

Planet: Sequencer. DV

MusiCom: 2 tracks + DSP effects. AV,SE

SMPTE track Platinum: Sequencer. AV

SPDIO: 44.1 and 48MHz for Falcon audio. AV

4I4O: Additional Analog ports. SO

AD64X: High tech AD-converter. AV

Additional software:

BlackMail: Voice mail. AV,SE

ATARI Works: Integrated business software. SO(AV),SE

ATARI Speedo: The new GDOS. SO(AV),SE

NVDI falcon: THE graphics accelerator. AV,SE

SuperBase 4.0: Data base. DV

MARC 4.0: Packer Shell. SO,SE ;-)

Games:

Ishar: Adveture. AV

Transartica: Strategic game. AV

Yuppie's Land: Arcade. SO

VroomII: 4 player Formula one. SO,SE

Suriya: adventure. DV

Black Sect: Adventure. DV

Space Junk: Adventure. SO

Raiden: Arcade. SO

Road Riot: Cion Op.

Steel talons: Helicopter 3D. DV

Cyber assault: 3D adventure. DV

Tornado flight simulator: DV

Striker: Soccer. DV

Eclipse: 3D space+DSP effects. DV,SE

Humans: Dinolympics. DV

Daughters of Serpents: DV

Rome AD72: DV

Harrier Avs: Flight simulator. DV

Chaos Engine: DV

Emulations:

Falcons Speed: 286/386 PC. SO,SE

Falcon GCR: Mac. DV

4869. Is there a Gofer port that runs on TT?

Newsgroup: comp.sys.atari.st
Date: 1993-04-01 11:28:31 UTC
From: avgroeni@cs.ruu.nl
Message-ID: <1993Apr1.112831.17016@cs.ruu.nl>
Source record: 207989

I tried my executables of the functional language Gofer on my TT,
but found that they don't work (bombs-- have you noticed that the
TT has a habit of showing long rows of bombs as if it had to prove
it is a 'bigger' machine than the ST?). Does anyone have a version
running on a TT?

thanks (otherwise I'll have to have a go at it myself when I
desperately need it)

> Where is the english version of Gemini? I believe I got it once, but it
> was in German. (Unless I'm thinking of another desktop program..) And what
> is the latest version number?

Latest version is 1.21, the UK (english) version is available from
ftp.cs.tu-berlin.de (130.149.17.7, mail-server@cs.tu-berlin.de,
pub/atari/utils/gmn121uk.lzh, 450 kB).

I don't like gemini, but I like the features promised for the next
version (perhaps this month).

GOOD NEWS!!!!!

My brother just informed me that he found out from one of his fellow Clarkson Engineering graduates who works for Commodore, that Commodore has chosen the RISC chip of future amigas! (drum roll please...) As many have speculated, it is the DEC Alpha! They are planning on announcing this at WOCA-NYC during Lew Eggerechts speech. Better yet they will be showing in a semi-private session the prototype Amiga-A with the Alpha (100Mhz) and the prototype new high-end AAA Chip set! (This computer is not due out until mid 1994, however) Expect truely blinding speed in this speed demon!!!!!

More details as I recieve them.

There IS a major difference here, if you want to run UnderWorld on your TT
you have to "crack" it. No matter if you've bought 100 copies, written to the
non-exisiting publisher, called the programmers or whatever.

Actually, when I come to think about it, my loading routine was written to run
on 8 MHz. If I try the same rout on 16MHz, I loading UnderWurlde should be no
problem... hmmm! B^)

Darek, I have to admit it - That was a really nice post. It was clearly written and not _particularly_ inflammatory. Also, I guess I did not realize that you subscribe to the BobR opinion of Atari (like the machine, hate the company).

Dogone it! If you keep writing intelligent posts like that one, I am going to have to re-think my personal opinion of you. <grin>

One other thing: Not all the schools in Texas produce illiterates; just the under-financed ones out in the middle of nowhere <big grin>.

4885. Sneak preview of the Intel port of NeXT's operating system

Newsgroup: comp.sys.atari.st
Date: 1993-04-01 17:50:54 UTC
From: mcgowan@emerald.physics.utoronto.ca
Message-ID: <C4tG8u.Lzp@helios.physics.utoronto.ca>
Source record: 208008

Keywords: NeXTSTEP, Intel, PC o/s

Reply-To: mcgowan@emerald.physics.utoronto.ca (Patrick McGowan)

"....From Black Computers to White - NeXTSTEP for Intel Processors"

The Toronto Area NeXT Group presents a sneak preview of the Intel port of the World's foremost object-oriented operating system.

The Battle of the Operating Systems heated up substantially on February 10, 1993 when NeXT Computer, Inc. announced that it was getting out of the black box (NeXT hardware) business and becoming solely a software company. Although there has been a mixed reaction in the NeXT community about this change of direction, most NeXT users were just as attracted to the NeXT world by its operating system "NeXTSTEP" as much as by the sleak, black hardware.

NeXTSTEP has a "super-Mac-like" graphical user interface, a wealth of powerful networking, communication and system administration utilities, and a dynamite application development environment. It would truly be a tragedy to see such an elegant operating system go down with a hardware ship. Anyway, it has been said that computer hardware is becoming merely a commodity. The real power and innovation in the computer industry is now in the hands of the software houses, and in particular those which control the direction of operating system development.

The race is now on to see who will set the standard for operating systems which incorporate the philosophy of "object-oriented" programming and design. NeXTSTEP is the most advanced object-oriented system software environment available on the market today. With seven years of development behind it and 50,000 users, it holds a substantial lead over other potential object-oriented operating systems being developed by the Taligent Consortium of IBM and Apple, Microsoft ("Cairo"), and others. Up until this year, NeXTSTEP was only available to the select few who owned NeXT's black boxes....now it is to be let loose on the Intel processor-based world with the release of "NeXTSTEP for Intel" on May 25, 1993 at the NeXTWoRLD ExPO in San Francisco.

I guess you will just have to fly to sunny California in May to see it....NOT!

The Toronto Area NeXT Group has got its hot little hands on an advance copy of NeXTSTEP for Intel and is holding a special meeting at 7:00 pm Tuesday April 8, 1993 at the Toronto Eye Institute to introduce NeXTSTEP for Intel to Toronto. The Toronto Eye Institute is located on the sixth floor of the Toronto (Western) Hospital at the corner of Bathurst and Dundas, in Toronto. We welcome all computer enthusiasts of any stripe to

join us. Jump the gun and see for yourself the future of computing!

Our EB has NO lynx stuff at all and hasn't since X-mas. Babbages supply
appeared to be dwindling for awhile but last weekend moved the Lynx from a
hole in the aisle to a big prominent wall rack and upped their game selection.
(Maybe a last ditch effort to get some Lynx games moving maybe?)

>really intended for use by the SCSI bus terminator.) I'm not aware of any
>drives that don't have this capability one way or another, but, once again,
>you may have to mess with the drive's jumpers.
>

I ran into this problem last month with my Seagate ST277N. According to Seagate tech support this drive does not supply scsi termination power and there is no way for it to do so by simply setting a jumper. Toad was happy to take the Link back and send me an AdSCSI instead, which draws power from the power supply.

>few weeks. The compiler will be ready in summer (if I recall that
>correctly).
< rest deleted >

Well, this situation gets muddier and muddier! So has Richter and GFA finally come to a formal agreement about the sale/licensing of the rights to GFA BASIC for the Atari or are they still fighting... er, discussing it?

On this side of the pond we get conflicting stories. It would be nice to know what's really going on and if we can actually look forward to a new version of GFA BASIC (or RBASIC perhaps?) eventually.

And since ST Format published the GFA 3.5 interpreter on their cover disk, that places that version in the pseudo public domain arena. Curious.

:
:
: This is my BIG moan about ZOO, it no good for people with 520k machines and
: single drive, I wish these chaps that run these archives sites would convert
: over to a better archiving format, at present ZIP would fit this bill..
:
I don't know I have a 520 and things seem ok. I'm not paricularily ST
literate, but I have few problems. With ZOO I think it has a slightly
different syntax to the other arcers but not much. Instead of
x sozobon.zoo
try
-extract sozobon.zoo
or
-extract sozobon

I know they're novice commands, but it's better than the thing not
working.

Yours

Paul Herzberg.

(Although thinking about it I may have only used zoo on the Universities
1040's, but I'm sure that I have also unzoo'ed the occasional thing
very slowly on my 520)

And anyway what is wrong with admitting your a novice? Especially as
it's only to your computer. I mean here on Usenet we have to have been
hacking from the age of two or no one will speak to you:-), but your
ST isn't that judgemental.

Figured it was something like that (though I lack the knowledge of the precise, technical details :-)). I've managed to fix (or at least reduce) the problem by cranking the width on my multisync as far as it will go. This doesn't quite go far enough, however, but it's good enough.

Using the same idea, I once made ST high really, really, tiny (hey, I was bored...).

Whoops, made a stupid mistake when I was talking about the lack of
documentation on the TT-scsi port.
Although the document describing the SCSI controller chip of the TT is not
part of the standard developerkit, you only have to contact Atari, and they
will send you the documents you need. IF you are a registered developer of
course.

Sorry about the confusion.

No, actually it was a consolidation. Babbage's moved ALL of its Lynx inventory
to the 80 or so stores that sold the most of it (that's under half of Babbage's
total stores).

Something totally off the subject: I just got a newsletter from the Summer CES
that listed Beyond Games as one of the games exhibitors. Not to say that I'm
accusing them of lying :) It's just nicer to see stuff in print. Battlewheels
should be out before then though, so you should have to go to Chicago to see
it.

Hey, John. Is that compatible in reality, or virtual reality? ;-)
At this point, it must be virtual reality, because the Falcon's are
virtual machines here in the US.

It sounds like you need to run the setup program again to get it
to boot from the HD or whatever you want to use.

It may be a fact worthy of note that today happens to be April 1, no?

If this post had been made on any other day, it would have very
slightly more credibility.

There's some of the installation at atari.archive.umich.edu; I'm not
sure of the path, but I did upload it.

Unfortunately, Powerdos is:
a) Incompatible with MiNT/MultiTOS
b) Seemingly not further supported
c) Provides an overly simple "multi-tasking" system for which only
the original author is currently able to develop applications

It MAY be faster than a good cache in speeding up disk access
(although that's not certain); I wouldn't trust my hard drive to it.

The ST can read PC-Disks of 720kb. You also can read them if
they're text files. But you cannot run them without an PC-Emulator.

> Perhaps it has been shown during the CeBIT, but hidden, only for devs, only
>for their eyes...

Yes, Atari presented the 040 to developers. We were very surprised because
it had an 060 in it instead of the 040. There were 25 bit graphics and about
ten slots for DSP cards. I doubt that these slots are of some use because
there were already three DSPs built in, one 92001 and two 56001.
The CPU speed was about 149 MHz, unfortunately this isn't as fast as the new
alpha chip by DEC but fast enough for the Atari market.

Tell your friend in France this rumour, maybe he enjoys it.
There weren't any new machines on CeBIT. Not for the public, not for
developers. So stop spreading such a nonsense.

4918. Civilisation on a Mega STe

Newsgroup: comp.sys.atari.st
Date: 1993-04-02 11:46:09 UTC
From: singlejf@cs.aston.ac.uk
Message-ID: <1993Apr2.114609.27503@aston.ac.uk>
Source record: 208043

I bought Civilisation for my Mega STe a couple of weeks ago. I was pleased to see that it would install on my hard disk, and that it ran OK, to start with.

I have been having problems with it bombing out whilst I have been playing it, usually reloading the saved game has just led to it crashing again in the same place. Also in one game I managed to finish, the replay sequence failed when it couldn't find a file, one that I couldn't find on any of the distribution disks.

I wondred if this is a problem particular to the Mega STe or whether anyone else has had problems on other Atari variants.

John Singleton. singlejf@cs.aston.ac.uk

Does anyone know how to stop call-waiting from within Flash 2? Using Uniterm I simply dialled *70,, to disconnect CW for one call. This does not appear to work for Flash. Has anyone successfully stopped call waiting from within flash? If so, I would certainly appreciate the details. Yes, I realize Uniterm is faster than Flash, and it seems to emulate the VAX system I dial in to, but I got Flash second hand from a friend, and I figured I'd like to try and use the back-ground download etc.! Anyone...please :^) Thanks muchly in advance,

T.T.F.N.

Hi... I bought Civilisation too. I'm using a 520 STFM (4 Mb RAM, Hard Drive, TOS 1.4) and it runs fine (off hard drive too!) It crashes a few times, but I thought that was just my computer, which isn't too reliable. Bugs I've found so far are...
(1) - It won't load save games (or save them) on any drive other that the one it was loaded off. I.E. I have to load and save on Partitiion E. However, When loading, I just tell the game to load off A (default) and it gives me a dir of E anyway. Try it...
(2) - The bottom line of the screen can be corrupted by the mouse. Not serious.
(3) - It crashes when you complete the game, looking for a file (slam.bbm or some such?) Which means you can't get a finishing score.
(4) - If you accidentally turn on CAPS LOCK, half the keyboard stops working. A pain until you figure it out.

The game's great, though... :). Is Microprose on the net, so I can e-mail them? If not, I'm going to phone 'em up and hassle them for an upgrade when they get it fixed. Mail me if you want a copy of the upgrade when I get it, okay John? Again, if anyone has their e-mail address, could they mail it to me? Cheers.

You can use 1Megx9 SIPP instead of 1Megx8 SIPP. They're
pin-compatible, except that 1 data-bit (parity) is not used. But don't
care about it.

In article <H.eg.5abhBc_TZA2@harvee.billerica.ma.us> esj@harvee.billerica.ma.us writes:
>
> I am very confused about backup options.

There are a lot of choices, and it seems like more every day. Plus, there are a number of factors to consider, depending on your intended usage patterns for backups, archival storage, secondary working sets, and so forth. How fast does it need to be? How often will you back up? How many backup copies do you need? Which will wind up costing more, the media of the drive? Does it need to run unattended? Etc.

> I had made up my mind to get
> a floptical drive for backups. when I called toad to order one, they
> said that ther were not selling flopticals because the price was
> bouncing around too much

This seems very weird to me. I would think they would sell anything they could get their hands on. It sounds more like they can't get any, possibly due to strong demand in the PC arena. Maybe some major manufacturers are bulk buying up all the inventory?

> and tried to sell me a syquest drive.

It does make sense that they'd try to sell you what they have. This is good business sense. However, it may not best meet *your* needs. (As a side note, although I think Toad is an excellent company overall, when I called to order the Beckemeyer disk repair utilities, they talked *me* into the MOS utilities instead, which in my opinion is total and unmitigated crap. I'd be ashamed to *give* this thing away, much less take somebody's money for it.)

[I've added some approximate cost per megabyte estimates below, for media only.]

> I decided to reconsider my options. for backup, I can use:
>
> flopticals $1.00/MB
> syquest $1.12/MB (for 88 MB media)
> 1/4" streamer $??/MB (no idea on this one)
> floppies $0.60/MB
> ICD tape $0.12/MB
3.5" opticals $0.31/MB
5.25" opticals $0.17/MB (plastic, glass is more)

Of course, media is only one factor to consider, and depends a lot on just *how much* data you need to back up. It can be very important though, especially if you plan to keep multiple backup sets,

with one or more located off-site.

> as I see it, the pros and cons of each are as follows:
> flopticals
> - can't get anyone to sell me one

This will change, I'm sure.

> - may be "fringe" media.

I don't consider this the case at all.

> + convient size
> + can buy supported drivers
> + drive and media can be used on other systems

I think in every single case that both the drive and media can be used on other systems. SCSI based systems are quite portable, and you can certainly re-use the media. However, they may not be data compatible. This would be the biggest problem for the ICD tapes, which as you point out below are recorded in a proprietary format. However, you may be able to use another driver to write tapes in a more industry-compatible format.

With the other media, if you stick to DOS formats, they'll probably be readable on most systems, possibly with a few manipulations on boot blocks and media descriptors, etc. But certainly, check it out to make sure you can take your data where you want to go.

> syquest
> - expensive media

Not much more than flopticals, but certainly more all at once (in one package). However, Syquest media is vastly faster at data transfer than flopticals are (roughly 10-15x faster).

> - may be "fringe" media.

Again, I disagree, but perhaps I don't know what you mean by "fringe"? Certainly, Syquests are in heavy use on at least the Atari, Mac, and PC platforms, and have proven themselves in years of use.

> + can buy supported drivers
> +- can be used as hard drive (but how do you back it up!!)
> + drive and media can be used on other systems
>
> 1/4" streamer
> - may be obsolete media
> +- free driver (lack of support??)
> + possible to read on other systems
> + drive and media can be used on other systems

I can't comment on the 1/4" streamers, since I have no experience with them. I know that in the early days back on PCs that they

were slow and unreliable, but I think they've improved a lot over the years.

> floppies
> - takes forever

This is true, especially if you plan on doing full backups all the time. However, an alternative strategy is to do incremental backups of just those files you create or modify. This can drastically reduce the amount of data you need to back up. There's no need to back up all the megabytes of applications, which can be restored from their master disks. (Yes, I know, probably a many houred project. But, this "poor man's" approach to backups can be very effective, up to a point.)

> - unreliable

I've found floppies to be pretty reliable overall, especially if you do a verify pass after writing. Of course, this slows them down even more.

> + have drive, media, and backup sw.
>
> ICD tape
> - mystery tape
> - propritary format
> - pricey drive
> + supported (but for how long)

This is the format I finally settled on, primarily because I run a software company that depends on not losing critical customer data or source codes. At first I too was scared off by what looked like a relatively high price, until I realized that I could just drop a hard drive in the same case as the Tape Backup unit, and take advantage of the case, power supply, host adaptor, cables, etc for "free". This made the effective cost of the tape backup far more palettable.

Of course, if you're not looking to add another hard drive to your setup, this doesn't do you much good.

I've already agreed above about the proprietary format. I'm not sure if Beckemeyer's SCSI tape utilities will work with it or not. Possibly one of the PD ones might. I do know that I can't access it from the Mac side with Spectre GCR (which is a shame, since Restrospect is really nice), however I can disconnect the host adaptor, and just plug the SCSI port into a Mac for backups.

The ICD tapes are very fast for doing backups and mass restores (6+ megs a minute), but are slow if you just want to get one or two files located at the end of the 2nd or 3rd save set, since they have to stream through the entire tape to get there. I.e., there's nothing random access about them. ;-) But you can just

tag the files you want from an expanded file selector, then do
some thing else for 5-10 minutes while the files are restored.
It would probably take me longer than that just to find them if
they were on (many) floppies.

> I would like a media/drive combination that has a chance of being use-
> ful for at least 5 years and on multiple platforms (dos, mac, unix or,
> maybe even another atari :-)
>
> any ideas?!!!

If you've already got a host adaptor in your system, with a 50-pin
Centronics style SCSI feed through, there are lots of drives you can
connect fairly easily to an Atari. Complete 88 meg Syquest boxes
for $500, 155 meg TEAC SCSI tape backups for $500 (I'm not sure about
drivers for these though), 128 meg 3.5" magneto-optical boxes for
$995 (or less, prices are dropping daily) with cartridges for $39,
650 meg magneto-opticals for $1,500 or so, and so on.

Hopefully, I've given you a few ideas. If you have any questions,
I'll try to answer them. I should probably be investigating some of
the PD or commercial SCSI tape drivers and backup software, because
none of the 15-20 tapes I've got in ICD format are going anywhere,
except to another Atari. This is fine for now, since I have 3 of
them, will probably be buying a couple more, and have access to 4
others, but who knows what the future will bring?

I see that in spite of the excess verbosity in my previous reply, I managed to forget to comment on the reference to "mystery tapes" in the ICD tape section. There's really no mystery. The Maxell part number is CS-600 XD, and they're widely available from many sources. I can get the TEAC part number too, if you need it.

I think that ICD sells them for $30, but from anybody else they're $24. Two or three Mac places (APS, ClubMac, ?) sell them for $19 a piece. If you want them in quantity, I think you can get them for $15-16 each. My cost per megabyte estimate was based on the easily accessible $19 single unit pricing.

C'mon guys, ease up. Darek may be a little "abrasive" at times but I don't think he deserves all this flak. And in regards to the Gemulator, I can tell you from first hand experience with my own unit that it works very well indeed (the new software is a tremendous improvement) and does all he claims in the ads. What more do you want? Since it's an emulator, I still don't think it's as good as the "real" thing in all ST tasks, but for those folks who simply must drop their ST for a PC (for whatever misguided reason) it provides a very viable alternative to dumping all their ST software.

Hey, it works. End of story. :)

>sells Quantum ELS drives for Macs.

I had the drive in my hands and could not find a jumper for parity. ICD says there isn't one, and that the drive comes with parity enabled. The drive did not work with the Link on my system. ICD told me the symptoms I was getting were indicative of parity being enabled. My roommate hooked the drive up to his Macintosh and it worked.

The Maxtor I bought allegedly came set to work with a Macintosh, and it came with parity enabled. Once I disabled parity on the Maxtor with a jumper, it worked right out of the box.

That's all I know.

Repeal prohibition. History repeats itself. Repeal prohibition. History r

I spent several months reverse-engineering my girlfriend, but I couldn't
crack her loader. Now I've finally done it, and you can find her on every
major FTP-site as /pub/cracked.babe

I also found out how the function Sex_Urge worked. It used to look like
this:

Action *Sex_Urge (BoolType Bed)
{
if Bed then
return NULL
else
```

```
return NULL
}
```

Now it's like this:

```
Action *Sex_Urge (BoolType Bed)
{
if Bed then
return SEX
else
return SEX
}
```

> the original author is currently able to develop applications

A and C are true, but B depends on your definition of support. ViewTouch Technology has acquired the rights to PowerNET and PowerDOS some time ago, and the original author is continually working on it. Gene Mosher of ViewTouch is on Fnet's Crossnet bases all the time. PowerNET/DOS is written by Chris Latham, the same programmer of Universal Item Selector III.

BTW, ViewTouch specializes in bundling touchscreens with TTs and selling them as POS and cash register systems. He's quite successful from what I hear.

4950. Looking for FAX software for Atari 1040ST

Newsgroup: comp.sys.atari.st
Date: 1993-04-03 02:39:40 UTC
From: groer@fnalj.fnal.gov
Message-ID: <2APR93203940@fnalj.fnal.gov>
Source record: 208174

Hi,

I am trying to find either public domain or very cheap software that will allow me to use my Atari ST1040 with a Zoom Telephonics Faxmodem which supports Class 1 and 2 Fax (it implements standards V.29, V.27ter, V.17, and V.21 channel 2 - whatever the hell they all are!).

I have already searched various ftp sites and heard from Jeff Weiner at umich that he is unaware of any public domain fax software.

If anyone out there can help me find something it would be much appreciated.

4952. Re: Darek, Atari & Texas

Newsgroup: comp.sys.atari.st
Date: 1993-04-03 03:53:44 UTC
From: darekm@microsoft.com
Message-ID: <1993Apr03.035344.10550@microsoft.com>
Source record: 208176

In article <1993Apr1.161618.23524@digi.lonestar.org> rgoseweh@digi.lonestar.org (Roy Gosewehr) writes:
>Darek, I have to admit it - That was a really nice post. It was clearly
>written and not _particularly_ inflammatory.

Oh my! I'll have to go re-read what I posted. I may have been under
the influence of Sudafed or something (I do suffer from spring allergies).
If I posted anything that DIDN'T offend anyone, I apologize. I'm losing it.
Old age. Or maybe the anger is finally going away (see below).

> Also, I guess I did not
>realize that you subscribe to the BobR opinion of Atari (like the
>machine, hate the company).

When I first worked at Microsoft as a college intern in 1987, I brought my
ST to my office because I prefered to do my work (such as email and editing
on the ST than on the PC. That's how much of an ST bigot I was! Flash and
Tempus and Megamax C and DEGAS blew away _anything_ that was available on
the PC at the time. I was the ST equivalent of a Jesus freak, busily learning
68000 assembler and figuring out how to write an Atari 800 emulator. But also
in 1987 they got on my bad side when their lawyer phoned me up and threatened
to sue me for writing the Atari 800 emulator. At the time, I was a starving
college student _thinking_ I was doing them a favor by writing an emulator to
help migrate their 8-bit userbase over to the ST, but they wouldn't hear of it.
So excuse my bitterness when I hear someone supporting those STUPID BASTARDS.
(There, offensive enough?) It's no secret that one of the main reasons for
developing Gemulator (other than it being a really challenging thing to do,
just as the 800 emulator was) is because I hold grudges for a long long time.

>One other thing: Not all the schools in Texas produce illiterates; just
>the under-financed ones out in the middle of nowhere <big grin>.

My apologies to the people of Texas. You're OK. After all, Texas produced
people like Wes Newell (the developer of the FastChip for the 8-bit Atari
and who didn't freak out at letting me use his ROM code in the 8-bit emulator),
Mike Vederman and Keith Gerdes of Double Click Software (yay!), George Bush
(no comment!), and the future Mrs. Gates (yay!).

- Darek

4953. SPICE!!!!

Newsgroup: comp.sys.atari.st
Date: 1993-04-03 04:38:10 UTC
From: smiller@farad.elee.calpoly.edu
Message-ID: <1993Apr03.043810.133053@zeus.calpoly.edu>
Source record: 208175

OK I am impressed! OLIVER FRICK IF YOU ARE OUT THERE PLEASE POST!

I d/led the demo version of SPICELINE a graphics postprocessor for
SPICE today from atari.archive.umich.edu and it was amazing!!!
If any of you have used Pspice before, SPICELINE puts it to shame!
You can actually use the mouse to zoom in on portions of VTC's, transients
fourier and other curves (although I don't think you need to zoom the
fourier analysis' :)). It is fast and smooth and much more professional
than the postprocessor that I use on my ULTRIX DECstation at school.
The screen is just beeeaauuutttiful in TT hi (ooo I am gonna have to try
TT med after I am done with this.) You can call SPICE while within the
program (just like Pspice) and you can have several windows with different
outputs open at the same time!

OLIVER FRICK I WANT A COPY!!! even with the German docs :(
There is an online help too so us English speakers probably could use it
fine... it seems that Oliver said that they sold SPICE too to go along
with SPICELINE, so my advice is ... all you EE types or EL types, order
this package so the company can produce an English manual, you all know
that the ATARI line of computers is sorely lacking in the technical area
of software so when people like this produce such a fine piece of
software let's support them!!!

from the SPICELINE text file their address and telephone is as follows:

DLM - Datentochnik
Dirk Lehmann
Saarlandstr. 74
2080 Pinneberg
Germany

tel : 049 4101 512199

Oliver how much does the package cost including your copy of SPICE?
Does your copy of SPICE take advantage of the 68882? and do you guys
take credit cards????
If you could answer here 'cuz a lot of us people would like to know!

I was reading on another group that there is GNU source for Fax software,
so why has nobody ported this to the ST/STE/ or what ever...

So come on chaps is the a source GNU of Fax software...???

Roger..... sheppard_r@kosmos.wcc.govt.nz

4956. Re: Overscan For Mega 'E

In <1p02ufINNr05@golem.wcc.govt.nz>, Steve Wells writes:

Hi Steve,
>The Overscan available on atari.archive.umich.edu (and elsewhere, including
>commercially), will NOT work on any machines above the STFM!
>(Or Mega-ST).
>It will not (apparently) work on TOS versions newer, or older, than 1.2
>(1.02), or 1.4 (1.04).
Overscan does not depend on the TOS version. I'm using Autoswitch Overscan
(the commercial version) on a MEGA ST (NO E!) with TOS 2.06 without any
problems (to be honest, there is one problem: My monitor can only display
672 x 480 pixels).

Let's get it right: There are three versions of overscan: the pd version,
the commercial versions called AutoSwitch OverScan (AOS) and OverScan TT.
None of these works on a STE or MEGA STE. OverScan TT is the only version
which works on a TT.

>If you have an STE, Mega-STE, TT, Falcon, you can forget about this
>overscan. (The Falcon has overscan, so you don't really need it anyway).
This is incorrect, too. There's a speical version of overscan called "overscan
TT" which works on the TT and increases the screen by ~ 50%. This version
is sold by Overscan for ~ 350 DM.
The latest produkt by Overscan is called "Screenblaster" and works only on
the Falcon. It offers up to 800 x 600 pixel in 256 colours with 87 Hz....

DE and DB are probably the best tools available for the task, at least in
english 8)

DLII and ReOrg are _ancient_ technology. Avoid them like the plague - I lost
the contents of my BBS to them several times. (would have been only once,
but I had a backup on tape so I was game enough to try again 8)

As for atari's chkdisk3, well, it gets _very_ confused sometimes 8)

A tip - the NeoDesk CLI is painfully slow - I'm not entirely sure why. One of my points ran (only once 8) his mail import session under it - what should have taken several minutes took over an hour (there's quite a lot of text output by IOSmail while it's unbundling stuff).

4959. Re: Overscan For Mega 'E

Newsgroup: comp.sys.atari.st
Date: 1993-04-03 15:37:00 UTC
From: m91der@tdb.uu.se
Message-ID: <1993Apr3.153700.9588@tdb.uu.se>
Source record: 208181
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

The reason why overscan doesn't work on STE/Mega STE is that the DE (Display Enable) signal that controls the borders are created and processed within one single chip, which makes it next to impossible to modify. In the old ST the DE signal is created by the GLUE-chip (if memory serves me) and then fed into the SHIFTER-chip. The overscan-mod works by providing the SHIFTER with another signal than that from the GLUE and by patching TOS so that it understands the new screen-format. Until recently (when the TEC was released) there has never been any demand for a version of overscan for TOS-versions other than 1.2 and 1.4.

4960. v19INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1993-04-03 19:10:08 UTC
From: koreth@spud.Hyperion.COM
Message-ID: <1pkneg$qa7@spud.Hyperion.COM>
Source record: 208182
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@spud.Hyperion.COM (Steven Grimm)
Posting-number: Volume 19, Info 1
Archive-name: Intro

[Note: as of volume 19, the structure of the articles will change slightly,
to bring comp.binaries.atari.st more in line with other moderated software
groups.]

This is the first of three introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup. A companion
article lists all previously-published binaries, and a third article explains
how to retrieve and unpack binaries posted by others.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@spud.Hyperion.COM

--------------------

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@spud.Hyperion.COM. If you are on a UUCP-only site, you
can send them to uunet!spud.hyperion.com!atari-binaries. Note that
comp.binaries.atari.st is not the correct place to ask general questions
or to ask, "Does anyone have software that does X?" Post such requests to
comp.sys.atari.st or comp.sys.atari.st.tech.

If you want verification of arrival, say so at the beginning of your
submission, or in a cover note. I try to verify that a program works,
and if I can't get it to work, I may hold up posting it for a couple of
days. Please note that, except in rare cases, software without
documentation will not be published. The backlog from receipt to posting
varies from one to four weeks depending mostly on the set of submissions
currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two
separately. (The comp.sources.atari.st address is atari-sources@hyperion.com.)
If I have to separate your sources from your binaries by hand, your
submission will most likely sit on the back burner for a while, or be
rejected outright.

Please include a description of your program at the top of your article.
Look at old issues of comp.binaries.atari.st for examples of the sorts
```

of descriptions I'm looking for. I don't write the descriptions at the tops of the articles; what you see is what the submitters gave me. If your program only runs in one resolution, or requires a certain amount of memory, please say so; I can't test it in every possible configuration to see what works and what doesn't. If a submission arrives without a description, it is likely to be rejected.

The preferred packing method is Zoo 2.1 with high-compression mode (the "h" flag) turned on. I will only accept binaries packed with an archiver for which source code is widely available. For the time being, this means arc, zoo (preferably 2.1), and some versions of lharc, though that's risky. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages. LHarc submissions may be rejected if I can't figure out which version of lharc I need to use to unpack them.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful to the users on the net, which is why I allow them at all.

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.binaries.atari.st: binaries and "information postings." They can be distinguished by the subject line:

Subject: v19INF2: Index of previously-published binaries

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v19i081: deadwrtr -- Ouija-word processor part01/01

identifies this as the 81st binary article in Volume 19. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v19i041: zx81 -- Timex/Sinclair emulator part04/39

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, tin, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article's body are auxiliary headers that look like this:

```
Submitted-by: jackt@atari.com (Jack Tramiel)
Environment: uue, zoo-high, high, tt
Posting-number: Volume 19, Issue 80
Archive-name: rsn
Supersedes: atw: Volume 10, Issue 10-15
```

"Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site. This will usually be the same as the "From:" line in the article's main header.

Certain information about the system configuration required to use the program is given on the Environment: line.

```
Environment: uuencode, 1meg, medium, high
```

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

```
uue - program is uuencoded (Dumas "uud" required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
zoo-high - program is a zoo 2.1 high-compression archive (zoo21 req'd)
lharc - program is an lharc archive (lharc required to unpack)
high - runs in high resolution (monochrome)
medium - runs in medium resolution
low - runs in low resolution
1meg - needs 1 meg of RAM
ste - requires an STe
tt - requires a TT
```

The Posting-number line repeats the volume/issue information for the aid of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

```
Archive-name: desktop/part01
```

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

The Supersedes header line, if present, indicates that the program replaces an earlier version. This is mainly for use by automatic archiving software.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-by header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

4961. v19INF2: Index of previously-published binaries

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: April 3 1993

_1. _W_e_l_c_o_m_e _t_o _c_o_m_p._b_i_n_a_r_i_e_s._a_t_a_r_i._s_t!

Here you'll find a wealth of software for your Atari ST, from games to spreadsheets to compilers -- all free and yours for the taking. This document describes exactly how comp.binaries.atari.st works, and tells you how to get started. Don't worry if some of this seems complex; it'll all become clear after a little use. The section "Getting started" at the end of this document is worth reading if you're new to all this. It gives you (reasonably) step-by-step instructions for obtaining the software you'll need to get going.

_2. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than normal text. Usually, a binary that is posted to the net will contain executable (program) files. Binaries are distinct from _s_o_u_r_c_e_s, which are the human-readable text files that are interpreted by a computer and used to produce binaries. Sources can be modified with relatively little effort, and are usually pretty easy to read. Binaries are not intended to be viewed by a human.

_2._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and electronic mail) are not always capable of handling a pure binary file. They are designed to handle textual messages, and the odd symbols and characters in a binary cause them to become confused, and often to mangle the binaries. To avoid this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencoding translates a binary file into text characters, so that the news and mail transport programs won't mess up. The disadvantages are that uuencoded files are about 30% bigger than the raw binary files they represent, and that you have to go through one extra step to get the binaries to work on your computer.

_2._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work properly. The extra files might be data files, help files, or maybe some instructions for the user. In order to easily package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown together.

Using Binaries -2-

To confuse matters even more, two new archive programs called "zoo" and "lharc" can also be used to achieve the same effect. Zoo is superior to arc in some respects, slightly inferior in others, as is lharc. Unfortunately, you can't unpack a zoo archive with arc or lharc, or vice versa (arc and lharc are similarly incompatible with each other.)

_2._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 55000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator will usually post introductory articles, including a list of previously published articles.

_3. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week or two of the time they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site ftp.Hyperion.COM has all the binaries stored in its archives. You can get to those archives via anonymous ftp, which is described below.

The other way to get binaries is to request them from Hyperion's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you. One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

Using Binaries -3-

To find out more about the archive server, send a mail message containing the word "help" to archive-server@spud.Hyperion.COM. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@spud.Hyperion.COM to report the problem.

There are other archive sites, too, such as atari.archive.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. Some sites, such as atari.archive.umich.edu and ftp.hyperion.com, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp ftp.hyperion.com", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information. A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect.

Spud also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of changes to the archive-server's index files for the binaries and sources groups whenever new files are added. Note that if your site gets comp.binaries.atari.st, requesting autoindex is pointless and a waste of net bandwidth. Send mail to autoindex-request@spud.Hyperion.COM if you'd like to sign up.

_4. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc and zoo on your Atari.

Usually, things are small enough to fit in one article, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source code, also suitable for compilation on UNIX systems, is available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be

a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to

_____
|- UNIX is a trademark of Bell Laboratories.

go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so don't give any of the parts the same name as the file that's being extracted from them!

On UNIX systems, you can also say (for instance) "cat part* | uud -" without renaming anything.

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass (with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files. A new version of zoo, 2.1, is in volume 15 of the binaries archive. You'll need the old version of zoo to unpack the new one. Zoo 2.1 is necessary to unpack "zoo-high" format archives (look at the Keywords: line of the article you're unpacking.)

To extract lharc files, you should first try the program "lhx104" in volume 15 of the comp.binaries.atari.st archives. It's not in compressed form, so all you'll need to do is uudecode the .TTP file. It will unpack some .LZH files. Unfortunately, there are lots of different versions of

lharc, most incompatible with the others.

Most archives contain documentation; refer to the instructions in a specific program for usage information and the like. If you have problems with a particular program, send mail to the submitter (listed near the top of each part.) The moderator doesn't have time to become very familiar with all the programs that are posted, so the submitter will probably be much more helpful.

_5. _G_e_t_t_i_n_g _s_t_a_r_t_e_d

A version of uudecode written in ST BASIC is available in spud's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's _s_o_u_r_c_e_s and not binaries). To obtain it, send mail to archive-server@spud.Hyperion.COM, with the following message body:

Using Binaries -5-

send sources/volume1 basic-uud

The archive server should reply quickly (the actual amount of time it takes depends on how your site is connected to the outside world) with the BASIC program. Take off all the mail headers and introductory text (everything above the line that says "10 ' UUDECODE PROGRAM") and bring the file to your ST using your communications program. (Refer to its documentation for specific instructions about that; every program does it in a different way.)

Once you have basic-uud, you should get all six parts of the program "starter" from volume 16 of the binaries archive. The "starter" program, when run, writes out copies of the utilities you'll need to start decoding and unpacking comp.binaries.atari.st articles. Send six more mail messages to archive-server@spud.Hyperion.COM, each with one of the following requests:

send binaries/volume16/starter part01
send binaries/volume16/starter part02
send binaries/volume16/starter part03
send binaries/volume16/starter part04
send binaries/volume16/starter part05
send binaries/volume16/starter part06

You need to send separate mail messages because some mail systems won't handle very large pieces of mail, and if you requested all six parts at once, you might never see a reply!

Copy all six parts of starter, in order, into a single large file. Then go through and edit out the extra text between parts. Everything between (and including) the "include" line at the end of a part and the "begin" line at the beginning of the next part should be removed. (Blank lines are bad, too; everything from the "begin" at the top of the first part to the "end" at the end should be a solid row of 'M' characters along the left side, except a couple lines above the "end.")

Use the BASIC program to uudecode the resulting file, then run
starter.tos. It will write out copies of arc, zoo, lharc, uue, and uud
(all described above.) You're ready to begin!

_6. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be wrong. Please
let me know if you see errors. Mail servers usually respond to the word
"help" alone in a mail message. Some of the sites listed below may not
contain full archives of comp.binaries.atari.st, and some may have other
files as well.

>to sue me for writing the Atari 800 emulator.

You would think they would have had their lawyer call to set up a licensing agreement so that they could have shipped it with STs! Imagine if IBM had switched to a protected mode OS with the introduction of 386 machines and then threatened to sue anybody who tried to make these new machines run DOS in real mode. It really goes to show why Atari is where they are today.

In article <2APR93203940@fnalj.fnal.gov> groer@fnald.fnal.gov writes:
>I am trying to find either public domain or very cheap software that will
>allow me to use my Atari ST1040 with a Zoom Telephonics Faxmodem which supports
>Class 1 and 2 Fax (it implements standards V.29, V.27ter, V.17, and V.21
>channel 2 - whatever the hell they all are!).

I was not able to find any 'cheap' FAX software myself and opted for
the TOAD Computers distributed STraight FAX! software. It cost me $95CDN after
shipping and everything else. They sell it for $69US. It seems to be a
reasonable bit of code, although there are some things I would like to have
seen. In any case, STraight FAX allows you to use your ST as FAX machine with
a class 2 FAX modem. It has a sortable phone number list, a separate send and
receive log file and a good scheduler. It uses *.J* FAX files but allows you
to convert from/to .IMG files. This useful for using bits of faxes in other
documents. It requires that you have GDOS loaded only for the printer drivers.
That is, it doesn;t use GDOS fonts (thank God). It had built-in printing
facilitites and will also allow you to clip out bits of received faxes and save
the bits as *.IMG files. The program accepts the .J fax files, ASCII text,
.IMG files and I think *.PI* files. I like it very much. As I said, it isn't
the most sophisticated fax software but is better than most. Worth the $70US!

Talking about stuffing it royally, what's this about Queensland removing all references to the Queen (should we say THE Queen and then we can get a good flame going (sorry - didn't mean it!!)) from all the legislature? Perhaps they could change their name next... to Republicanland??

>;-)

All smiles for Easter...

David.

Oh yes, the vote for comp.sys.atari.advocacy has closed... wait for the result!

There are quite a few good WP's around, depending on how serious you want to get. Surpisingly, the new Atari Works is one of the better ones if you want nice output but you're not too heavy on things like indexes and tables of contents (it has an excellent dictionary/thesaurus - the Merriam-Webster one).

Protext from Arnor is pretty cool. Calligrapher, in its various incarnations is also pretty cool. That's Write works well, as does Script, and Tempus Word.

There are more, I know.

You will want to contact Multilearn there in sydney - I don't have their number, but the adelaide number is 02-373-0644. (that's their head office anyway 8)

z> Could you not post this on the news-net. I think a lot of us would be
z> very interested!

It'll be a bit big 8) I've seen the faxed version of it - about 9 metres
long 8)

Would you believe it, JVC have a package ready that will let you control
your JVC hifi system (incl TV and VCR) with your falcon? Of course, thats
more a side benefit, as the whole idea is to use it to control their
professional video gear in a video studio.

Let's see, other keen things : autodesk animator, a reader for the Microsoft
Bookshelf CD's (and NO, all you pathetic whingers out there, you _don't_
have to wait for an atari CD-ROM drive, you can use 3rd party ones 8) ..
heaps more, but I didn't have time to take a photocopy 8(

Well I have the Mono only version of Script 1, sold by Magamax,
is there a way I can update to the a English version of Script 3..??

Or has Magamax closed down..??

I have just had a look at Script 3 demo, it now runs in medium resolution..

I think this would be the best Word Processer for the Atari, I have found
it easy to use and with all the font options this takes a lot of beating,

The output looks very nice on my cheap HP. Deskjet.

I did here that the Megamax version did not sell to well in the USA,
was this because it was Mono only..??

May be Megamax should have another look, as that is no longer a problem,
thats if they are still around..

What other stuff from Application Systems did Megamax sell..??

Roger.............. sheppard_r@kosmos.wcc.govt.nz

4974. strange Neodesk problem

Newsgroup: comp.sys.atari.st
Date: 1993-04-04 14:23:05 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <4APR93.09230579@cc4.crl.aecl.ca>
Source record: 208198

On Saturday morning, I used my trusted Mega4 for several hours (wrapping up income tax work) and then shut the system down. In the afternoon, when I tried to re-boot the system, I ran into a VERY strange problem. Everytime the NEODESK desktop started to load the Mega would crash.

I tried removing all but AUTO folder programs with asterisks, which are listed below. I also tried removing all .ACCs. Finally, I re-configured XBOOT to not autorun NEODESK and voila, the problem went away.

Now, I can boot to the ST desktop (TOS 1.2) and run NEODESK from the desktop but I cannot autorun NEODESK. This seems very strange considering that I have been autorunning NEODESK from XBOOT for at least 6 months.

Does anyone have any idea about what the problem may be? My system configuration is listed below:

Configuration:

Hardware
- Mega4ST, AdSpeed, SM125, REFLEX card
- Seagate ST157N (LUN 1), Quantum ELS170S (LUN 0)
- SLM605 laser printer

ICDBOOT.SYS settings
- read/write cache enabled
- log sector size = 2048
- TOS/FAT buffers = 20
- # cache blocks = 15
- # sectors in block = 8
- extra folders = 1024

AUTO folder
- XBOOT (2.59)*
+/- autostart NEODESK 3.01
- FATSPEED*
- PINHEAD*
- REFDRIVE*
(REFLEX card driver)
- NEOLOAD
- UIS_III
- SERIALFX
- QUICKSTM
(never able to run WARP_9 without crashes)

- AUXINIT
- DB_EYES
- STOPDRV
- XBSTART
- G+PLUS
- ADSPEED
- DIAB630

>
>
> Atari in BIG Trouble.

They've been in BIG trouble for _years_, but the people who run the show
in Sunnyvale haven't been bright enough to realise it. You do realise
that last year, they released a "new" computer that was a 16Mhz 68000
with a maximum resolution of 640x400... The MegaSTe should've been out
in 1987. The Falcon030 should've been out the middle of 1992; now it's
doomed.

> Recently while checking out several stocks on the open market, I took a
> chance to look at my favorite computer, Atari. Now sitting at 1 and 1/8 on
> AMEX, Atari looks to drop to an under a dollar stock in the next quarter.

It _used_ to be a good stock. People that bought Atari stock in '83-86
are pretty peeved these days, if they've still got it.

> This is bad enough without the following. I checked out Motorolla and Intel.
> Motorolla had a small story about how Atari had still failed to pay them for
> the 68030's and DSP 56001's that were being used in the Falcon. Also the
> custom RISC chip they co built and designed with Atari is also unapid.
> Basically, Motorolla is quite pissed.

That's gotta be the least likely thing I've heard in days (and I read
alt.religion.kibology and alt.slack before I read comp.sys.atari.st);
Motorola is a BIG company. Companies don't get BIG by _giving_away_
their products for six months to a year. And besides, _why_ would they
give Atari '030s and DSPs for free? After all, they've got Apple
sitting there willing to fill their coffers with silver.

> WHy all this trouble? Atari does not have the MONEY to pay their bills, yet
> alone build the Falcons in mass quantity, which is the heavy rumor as to its
> real delay in mass release.

According to the less-than-reliable sources at Sunnyvale, Atari's got
$50 million in the bank. Naturally, it's doing no good sitting there;
it should be paying for ADVERTISING and production... apparently the R&D
for a Falcon040 is done, will it ever be produced?

> While I will use my ST until the day it croaks from over usage, I doubt Atari
> will be around in a year. And just to mention, Commodore is right behind Atari
> at 4 and 3/8 and falling fast. It is expected to end up a 2 dollar stock by
> June.

I still think a '486 with OS/2 would be a much better idea. From the
x-posts coming from comp.sys.amiga.advocacy, C= is making the same sorts
of bozo moves we all love Atari for.

I think that if I were using MiNT all the time, I'd probably either use
Terradesk instead of Gemini (and have TOSWIN loaded), simply because
it's smaller. When a newer MiNT/MultiTOS-aware Gemini is released,
it'll be much nicer.

Oh yah, and Steve Sowerby (that might be spelled wrong, sorry Steve!) is
working on a nice (and I do mean _nice_) MiNT/MultiTOS desktop
replacement. It just went into its first beta a little while ago...
Handles weird filesystems, does file operations in the background, etc,
etc...

How about one Falcon Compatibility List with a rating of "1", "2" or "3"
after each program? Good programs would have (1,2,3) after them.

You might want to add a "works with '030 caches off" if there's any way
to do it from the standard Atari desktop.

There is some code on GEnie which I once remember stumbling across which
has how to do this, though I suspect they're protective of it.

4982. Tour of England

Newsgroup: comp.sys.atari.st
Date: 1993-04-04 20:11:25 UTC
From: sl0s594@outb.wimsey.bc.ca
Message-ID: <sl0s594.0c90@outb.wimsey.bc.ca>
Source record: 207811

Hello.... My wife and I are going from Canada to England for the month of June, 1993. (Does this message area reach England?) Our tour will take us from London, to Edinburgh in Scotland, to Inverness, to Carlisle in Cumbria, to Stoke-on-Trent in the Midlands, to Shrewsbury (and throughout Wales), and to Gloucester, and possibly points in Sommerset and Devon. (We have an uncle in Looe in Cornwall, too.)

I am interested in getting together with any Atari ST, STe, TT, or Falcon user to see what computing is like on the other side of the pond!To make it worth your while (and to make it relevant to this message base), I have Star Trek the Next Generation in VHS format, and can bring selected episodes with me.

Contact me through E-Mail, or write to:

Stuart Lyster,
13800 Blackburn Ave,
White Rock, BC Canada V4B 2Y8

Well, Atari Interface is definitely history. I don't know what the story is with Advantage, but they're at least 3 months behind. Atari User is still hanging in there, although problems have resulted in delays. Hopefully, they won't bite the dust as well.

Current Notes and ST Informer (both good mags) are still publishing on a regular schedule. You might want to check them out. Atari Explorer is so sporadic that I wouldn't even worry about them.

> I must admit I'm beginning to think that I own an orphan computer.

It is starting to feel that way. If Atari doesn't pull their fat out of the fire pretty soon, there won't be anything left to save. I can hear it sizzling now. :-(

Once again one of the few u.s. atari users on the irc #atari channel speaks
on what we face.
As atari users we need to face some harsh and painful facts:
(note much of below applies to u.s. users)

1) Atari computers are not popular machines in the us.
2) Atari does not hold a significant position in any market
3) There are to many unreleased atari products (Falcon, Mtos, Speedo Gdos,
Atari-Works)
4) Dealers WHERE ARE THEY (none in my area - area code 518 New York zip 12180)
5) No advertisements ever and i doubt the ST or falcon will ever be advertised
here.
6) Never was and i doubt there will ever be a commercially available cd-rom.
7) Puny joysticks (need more buttons for us mortal combat types)
8) No computer shows on the east coast
9) Ataris non-aggressiveness in this country and the world.
10) And the poor lynx users, dealing with new titles at the rate of 2/year

its a sad day, week, month and year !!!!

please email me if you can refute this or have any uplifting atarinews besides
april fools :) ....

ell, I had heard this ROMOUR about Toys R Us as well. It is not true. It may be the case that some TRU stores have stopped carrying the LYNX but certainly not all. I happened to be in the TRU in Manchester, NH a couple of weeks ago and had a look. Yes, they still sell the LYNX. It was right in there with the Lameboys and GameGears. Plenty of accessories and what I would guess to be all of the games available for the machine. There was absolutely no indication that they were planning on dropping it.

Well I just received the latest copy of Atari Interface Magazine. It was a _VERY_ low cost printing. 32 page colorless commic book.

It was delighting to get a message from them. It was also delighting to see their 2 page article on the death of Atari. They even got a specific date and (well, maybe not...) time. I think that makes their advertisers happy to see....oh well, I am still a hobbist, Atari is still a good home computer, there is not knocking that....

4992. GDOS * Please help

Newsgroup: comp.sys.atari.st
Date: 1993-04-05 02:27:05 UTC
From: gregs@eskimo.com
Message-ID: <C4zo57.LA0@eskimo.com>
Source record: 207813

Hi all,

I've seen some messages lately about GDOS, but after backtracking I could no longer find them.

I'm having lots of trouble installing GDOS fonts. I've tried AMCGDOS, which is very verbose in its help messages. Unfortunately, I don't read German.

GDOS 1.8 gives me an "error -66" (TOS Error 35), and GDOS 1.1 tells me "Invalid Workstation ID in ASSIGN.SYS". I'm not sure what this could mean.

ANY help would be appreciated on how to use GDOS. I bought my STe used, and there was no documentation about Gdos with it. In fact, I don't think I've ever seen any documentation on GDOS. I'm using a 4meg STe with TOS 1.6 (monochrome). I'm trying to install a bunch of fonts I got from the atari.archive.umich.edu archive.

Please help! email preferred.

Thanks in advance,

Does anyone know of a good, new Term Program for the ST? I am/have been currently running Interlink v1.85 for the past, 4 or so years. I have'nt really looked for anything new, as I am happy with Interlink, but just curious as to know if there are any newer better programs, or even versions of Interlink..I've got a copy of Masterlink, which was the newer version of Interlink about 3 1/2 years ago, don't think it was ever realeased, though.

Also, I just got a USR Sportster 14.4 v.32bis v.42bis faxmodem the other day. Does anyone know of any software that I can run this with?

ALSO, (Sorry, the board I'm on just hooked this up in the net today, and I've been dying to find an ST board for quite some time now) we've got the files section on here, but I've heard you need some kind of program to decode them? Where do I get it?

Ok this is a request for help. Would you have read this message if
I had said "Strange Flicker infests multicolor programs?"

When I have the desktop displaying, or and color program running in
Medium Resolution, I get a flicker (or bands) on the screen. If I was
video taping the screen I would see the same phenomina greatly exagerated.

When I get a large band of white on the screen, the flickering goes away.
When the floppy drive goes on and draws some power away from my fan (which
I installed to the right of the 1040ST power supply) the flickering stops.
When I move the mouse back and forth continuously, the flickering goes away.

What should I do to fix this? Has anyone else experienced this. My hardware
follows:

1040ST
JRI memory expansion 4Mbytes of 70ns SIMM memmory (1 SIMM is 80ns), no
extra video shifter chip
PC Speed card soldered on top of MC68000 (under floppy drive)
TOS 2.06 (TEC Card) soldered to pins on PC Speed which is on top
of MC68000
DC 12V .09Amp brushless fan between power supply and floppy drive, glued
to the top of the case. Fan is over the TEC card and has about a
1/2" gap between the two devices.

Well they did get taken over, also they did do a update to Alternate
Reality-The City, they updated the ST version to 16 colours the same as the
PC version at the time, I read this in one of those old 8 bit magazines, you
had to send your disk back to get the update..

The reast got droped because of poor sales...

>No idea, but the machines that have been making it here are selling quite
>well.

It's very understandable that ATARI gives the priority to the european
(German, English) market at the moment. Here they can sell every FALCON
they can produce without any effort at the moment. So they can make
good and fast money.

Last week our local dealer got 10 Falcons, and they were sold in the same
week. But I'm quite sure the next Falcons will reach the US, too. Because
this time at least the musicians will hear of it in the US, too.

Hello,

Is there a GCC for the Falcon?

That is:
- a compiler generating 68030-code.
- an optimizer adapted to Falcon needs.
- os-bindings, libraries.
- etc.

And this in 1 package?

I know there is a GCC for the ST, but that is not
what I ask. Any pointers to the whole or part of such a package,
if it exists, would be appreciated.

5002. 520 STFM price cut in the UK (a re-introduction)

Newsgroup: comp.sys.atari.st
Date: 1993-04-05 10:43:58 UTC
From: etlgtme@etlxd20.ericsson.se
Message-ID: <1993Apr5.104358.6091@ericsson.se>
Source record: 207826

The May issue of ST-Format landed on my doormat this morning and its front cover declares that Atari have announced a re-introduction of the 520 STFM at a new price of 159 UK-pounds, a reduction of 90 pounds. Here's a few snippets from the atricle:

"Atari are bidding to rejuvenate the ageing STFM by dropping its price to a staggeringly low 159 pounds - and it is strongly suspected that the firm will also be dropping the prices of its STEs later in the year.
The manufacturer stressed that the new move is not a price drop but a "re-introduction of the machine at an ultra competitive price point."
Atari believe that at its new price the STFM can recapture some of its old glory days and hit sales of 150,000 units in 1993. Atari's Marketing Manager, Darryl Still, told us that they had considered dropping the eight year-old machine altogether but decided on a revamp due to perceived demand from retail. New, cheaper production techniques are being used to manufacture the new batch of FMs. This makes the low price point possible but also means that the machines will be extremely difficult and costly to upgrade. Still described it as "definately a workshop job."
He went on to explain Atari's rationale behind the introduction: "The plan was for the FM to be superceded by the 520STe. We intended publishers to write to the 'e' and produce a software base that was even more impressive than the Amiga's. Unfortunately, publishers didn't do that, they continued to write to the base machine."

other quotes: "....it will definately put pressure on consoles like the Mega Drive and Super NES."
"....it gives the consumer the option of a real computer for the same price as a console."
"....(Darryl Still) I think the new price gives the STFM at least another three or four years of very healthy existence."

I just don't know if this is a good move or not by Atari. They claim that this is "no panic measure, no last stand" but I can't believe that. I have watched the number of new Atari software titles drop to a trickle compared to the Amiga and PCs. They showed an interesting graph which claimed that in 1992 in the UK, the ST claimed 5.7% of all software sales, with the NES at 4.6%, Gamegear 4.4%, CPC 3.9%, SNES 3.7%, PC 3.3% and Lynx 0.7%.

Whad'ya reckon Guys??

>reliable. Bugs I've found so far are...
...
>(3) - It crashes when you complete the game, looking for a file (slam.bbm
> or some such?) Which means you can't get a finishing score.

This bug bit me too when I conquered the world the first time. Fortunately I had saved the game a few minutes earlier.
After some hacking around with MonST I also managed to fix the bug!

The file it's looking for is called slam2.bbm, but on the disks there is only a slam2.lbm. If you rename slam2.lbm to slam2.bbm it all works fine! :-)

Try it out!

By the way, I got a score of 992 points and 19% in the year 2003 (easy level).
What are the current top scores (after you've applied my fix of course)?

5004. Hard Disks in the UK

Newsgroup: comp.sys.atari.st
Date: 1993-04-05 11:17:35 UTC
From: pcxkrm@unicorn.nott.ac.uk
Message-ID: <1993Apr5.111735.11203@cs.nott.ac.uk>
Source record: 207830

Has anyone else in Britain had a problem bying a hard disk recently? - I've been trying to get hold of one for over a month now. Ladbroke Computing kept telling me that the problem was with the supply of ICD interfaces, until last week, when they assured me of delivery. However, this morning they tell me that the interfaces didn't arrive after all, and that means another wait. Everywhere else I've tried has had different excuses. Evesham Micros stopped selling HD's for the ST a couple of months ago (no reason given). Power computing I haven't been able to get through to on the phone, but they don't have the size of drive I want anyway - I want something around 60-80Mb, and they only advertise 40 or 100, the former is too small, and the latter too expensive! Also, they use the ICD stuff as well, so presumably have the same problem.

I tried several places who advertise the Protar drives - none of them had any. One place offered me an Atari Megafile 30 - the only time I've actually been _offered_ anything - but this is far too small. I suppose I could buy two! (maybe not...). They didn't have the Megafile 60, unfortunately, which would have done nicely - another place I tried that was advertising these said that Atari had stopped making them, so they didn't have any either.

So, does anyone know what the problem is with ICD? - I assume Ladbroke are telling me the truth, and they seem to have the actual drives in stock. Are there any alternative SCSI interfaces of the same quality and reliability? If so, where can I get them from?

Keith.

>TT has a habit of showing long rows of bombs as if it had to prove
>it is a 'bigger' machine than the ST?). Does anyone have a version
>running on a TT?

Gofer does not run on the TT because of its very strange signal()-handling.
I recompiled it using Lattice-C (which was easier than using Pure-C because
of some very dirty segments in the Gofer-sources).
The result runs fine under MultiTOS, but it's got some important restrictions:

1. It will no longer run on 1 MB machines, since it uses large static arrays.
2. The version I compiled is not up-to-date.
Recompiling the UNOX-sources using Lattice-C isn't quite easy, since Lattice
only allows up to 32k of code+static data per module, so I had to cut
the existing source into pieces, which makes a fast updating to new versions
nearly impossible. Since my time is limited there is no up-to-date-version
for the Atari.

It should be quite easy to recompile the whole package under GCC.
I haven't tried that yet, but it should be absolutely possible.

You should be able to get the sources from your local server or via ftp from
the programmer at yale.edu.

Regards,
Laurenz

You should be able to get the higher SCC speeds simply by picking
Serial 2 or Modem 2 from the "Communication Port" dialog. Selecting
one of the SCC ports will make the extra speeds available in the popup
menu of the "Port Settings" dialog.

Have you tried GASTEINER ?

I have a 50Mb (24Ms) Seagate Gasteiner Mega Drive (not to be confused with the Sega Mega Drive, BTW Sega are threatning to sue under "Infringement of Trade Mark" unless Gasteiner change the name) and it works just great. It's a bit bulky though, about the size of a medium pizza box. Here's a few configs for you to ponder over (not quite 60-80 Megs, but close):

GASTEINER MEGA DRIVE (50Mb, 24Ms, Seagate Mech) GBP 289.00
GASTEINER MEGA DRIVE (52Mb, 11Ms, Quantum Mech) GBP 309.00
GASTEINER MEGA DRIVE (87Mb, 14Ms, Quantum Mech) GBP 399.00

You can call them on 081 365 1151.
I'm not sure if they have any in stock, but there still advertising them.

Good Luck,
Grant.

I wanted to thank all the people who helped me with the zoo archiver,
after I used -extract instead of 'x', everything works fine.

thanks to:
obryan, husfeld, BWEBSTER, David Paschall, Richard M. Venable, anisko,
cummins, Kevin J. Klasmeier

Now that I have that working, I have run into a problem, How do I
unarc a file that is bigger than a standard double density disk when
I don't have a harddrive. Well, the program is the opus spreadsheet
and I believe if I unarc the program without the documentation, I
should be able to squeeze it onto a disk, and then the docs on
something else. I don't have enough system memory to make a Ramdisk
bigger than a DD disk...

How would I do this with .lzh, .arc, .zoo files... Opus is in .lzh, but I
guess the general knowledge will do me good.

Any takers?

Well, hows this for a bit of cheap advertising.....

1st Word Plus, RRP 80 quid, though you'll probably get it cheaper from a dealer. Call Electric Distribution on (0480) 496666, in UK for details. It was one of the first wordprocessors and does include a spell checker and reasonable dictionary, runs under GEM.

Other word processors that come to mind are Protext, Thats Write, ST Write...though details will have to be from someone else.

From: jpa@cs.bham.ac.uk
Message-ID: <C50MAH.Loy@cs.bham.ac.uk>
Source record: 207838

I'm having a few probs with the td background command. Firstly, when using this command to draw the background in the foreground (in front of the 3D objects as described in the manual) I get weird discolouration when an object goes behind the background (it looks as though the object colour has been ored or anded with the background colours). Is there anyone out there who knows what's going wrong.

Second problem. Ideally I would like to draw behind the 3D objects (with the polygon command), and use td background to draw infront of the 3D objects (as described above). Anyone got any code/ideas on how to do this.

Any help most gratefully received,

Jonathan.

5015. New mg2a for atari and MINT

Newsgroup: comp.sys.atari.st
Date: 1993-04-05 16:03:40 UTC
From: lemmens@dutind4.twi.tudelft.nl
Message-ID: <1993Apr05.160340.23845@donau.et.tudelft.nl>
Source record: 207843

I have made a port of mg2a to MINT, based on the BSD-UNIX sources. Works with termcap, so can
be used over a modem as well.
All know bugs are fixed: dired works well, regex works excellent, cursor and functionkeys work,
apropos doesn't cause any bus errors any more, subshells can be started so this might be a very
good replacement for your old mg.
Also runs - with a few limitations - on a normal ST (no dired, no remote terminals, no subshells)

I also made a new port of the normal mg2a, because the old one had several nasty bugs. This one
also supports regular expressions and has a good working dired mode and apropos.

Most of the bugs where caused by passing NULL pointers to string handling functions or by assuming
sizeof delivers int and not long.

Will be available on atari.archive.umich.edu as soon as I am able to log in ! (Maybe tomorrow ?)

Unfortunately, the trick does *not* work on all host adapters.
Protar and Vortex host adapters refused to cooperate 8-(

> but this trick (using linked commands) doesn't work
> with all SCSI devices (notably Quantum's).

I think I tried it once or twice on a Quantum drive, and it
worked well (again, depending on the host adapter), but I
might be wrong here, I just can't remember for sure.

That's not true. Doesn't ICD sell CD-ROMs for Atari computers? Anyway,
you can buy *any* SCSI CD-ROM drive and hook it up to your Atari,
either directly (TT/Falcon) or through an ACSI host adapter.

> 7) Puny joysticks (need more buttons for us mortal combat types)

I will never understand why people buy Atari computers to use
them as a game machine (except, maybe, for the Falcon) ...

I agree, however, with the rest of your list. 8-(

>on what we face.
> As atari users we need to face some harsh and painful facts:
> (note much of below applies to u.s. users)
>1) Atari computers are not popular machines in the us.

They are a cult computer, popular among a minor segment; the
problem is Atari marketing and production strategies with regard
to the U.S. market.

>2) Atari does not hold a significant position in any market

Too right-- except perhaps musicians with MIDI synths, definitely a
niche market.

>3) There are to many unreleased atari products (Falcon, Mtos, Speedo Gdos,
>Atari-Works)

Atari has been long on promises, short on delivery since the Warner
Bros. days; JT's boys have done little to change that.

>4) Dealers WHERE ARE THEY (none in my area - area code 518 New York zip 12180)

They are still several in the Washington D.C. - Baltimore area, but
they certainly don't blanket the country. Have you checked Buffalo,
or maybe Erie PA?

>5) No advertisements ever and i doubt the ST or falcon will ever be advertised
>here.

Atari never advertised very much in the U.S.; they may never have
had the production to meet the U.S. market, but then again they've
never really tried, have they?

>6) Never was and i doubt there will ever be a commercially available cd-rom.

And that's surprising, especially that no third party has addressed
that particular failed promise of Atari (due 'real soon' when ST 1st
came out; big disappointment to me that it never materialized).

>7) Puny joysticks (need more buttons for us mortal combat types)

Atari joysticks were always crap; get a Wico.

>8) No computer shows on the east coast

Ever hear of the annual WAACE show? There's also active user groups
in several areas, like Boston. Just maybe not in Rochester, NY. You

are being a bit parochial; there is an outside world.

>9) Ataris non-aggressiveness in this country and the world.

Yeah, well, do they have anything to be agressive about?

>10) And the poor lynx users, dealing with new titles at the rate of 2/year

Yes, it's surprising, although perhaps the market for hand-held
video games is a bit soft; and the GameBoy is generally cheaper,
although inferior (2" mono vs. 3" color screen, etc.)

The 32K limit is on code per module, rather than data; if I get half I
chance I will remove that limit in the next release. (But higher on my list
of priorities is wchar_t == short for better Speedo support).

No 040 at the Cebit but a new casing for the Falcon from a third party.

The casing slides over the original Falcon motherboard and contains a
adapter for a PC keyboard, not really a neat solution but better than the
original casing. DM 199,- that's about $120,- ...

>the most sophisticated fax software but is better than most. Worth the $70US!
>

Could someone please give more information on how this software actually does its scheduling? Does it run in the background to intercept faxes at all times? Is there a DA for that capability? I have seen some nice MAC Fax software that will replace any 'print' menu item with 'FAX' when the Command or Option key is pressed. (With the non-standard Atari interface though that print command can change from program to program). Basically, how does it interface with other programs, if it does at all.

Is anyone aware of if or when the following will be implemented:

Group 3 (currently the standard over 2 and 1)
How does it communicate with the ST? (Class 1, or CAS)?
Background communictions with other programs to avoid any intermediate steps to get the document into a faxable format.

Fax software on the Atari seems to be lagging behind the quality for other systems like the Mac. Is there anyone out there working on closing that gap?

Has anyone seen these programs lately? I have all three, and occasionally use them, but have lost the DOCS for them. I especially need the docs for DIGIVEC since I forgot what some of the vectors are to which I can attach sounds.

Is there anything like Sound Master(?) on the MAC, of which SAM is supposed to be like, for the ST line other than Digivec?

I have looked for Digivec, Click and Beep on various archives, but cannot seem to find them.

> - etc.
>
>And this in 1 package?

Yes.
>
> I know there is a GCC for the ST, but that is not
>what I ask.

Then you don't know what to ask for! GCC for the ST runs on all Atari 680x0 based computer systems. The compiler and assembler fully support 68020, 68030, 68881, 68882, and 68851 in addition to 68000 and 68010. (68040 support is not present in the current version of the assembler, but the new version of GAS will be ported soon, I'm sure.) If you already have GCC for the ST installed on your system, then you already have a Falcon-usable C compiler ready to go. Just use the gcc option "-m68020" to get 68020-specific code generation. (There is almost no difference between 68020 and 68030 for user-code, only the supervisor-level MMU instructions are added to the 68030. User applications shouldn't be using these instructions anyway, so the compiler doesn't need to know about them. The assembler will assemble them properly, though.)

Any of these archivers will allow you to extract a single file from the
archive, as opposed to extracting all files from the archive. If the single
file is still too big, you couldn't have used it anyway... In general:
<archiver> x <archive> <filename> [<filename> ...]
e.g.
zoo x bigzoo myprog.prg somedoc.txt

Reading your email, I thought you had the docs, so my reply was
probably confusin. Anyway, the latest (i.e., last) versions of all
these should be on atari.archive.umich.edu in

atari/sound/players/digistuf.arc

Since I can't ever get on the blasted archive anymore ("too many
anonymous users"), I don't know for sure. :|

I'm not sure if it's possible to write a program that triggers sounds
on window opens and closes. The problem is that the GEM desktop
doesn't use the AES trap for these things -- it calls its own code
directly; at least, that's what seemed to be the case when I tried to
do this several years ago.

All the Australian readers of this thread would be interested to know
that Atari Aust. have hired the advertising company "John Singleton
Advertising", which is the same company that did the "Beer Man's beer" TV
advertisements recently. (For the rest of the world, these AD's caused a
real stink over certain scenes showing a dog removing a womans jeans as
men (with stubbies in hand) looked on...)

And consequently they were responsible for the advertisements comparing
the AMIGA 1200 against the STE. My first thought was that the atari is
now the "Beer man's computer" !!

just to add my two cents worth, I personally think that the
advertisement was grossly inaccurate, (as with any comparison), but not
being a ST, AMIGA, MAC or PC fanatic I think that Apple also has a lot
to answer for it's comparisons with the PC range...

BUT, it could've been worse ... AS i saw copies of the drafts for the
advertising campaign, and that AD could be considered very tame !

Kym,
(yes Miff, I'm still resurecting ST's,and have you bought LC5.5 yet?)

"`Get back' I screamed, `I'm an Australian!'.I new this was a pretty
lame excuse and prepared myself for the truth. `Australia is merely an
Island of Antarctica' came the voice,`and of no further significance.'
Suddenly I understood the secret of Atlantis."

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <78905@cup.portal.com>
Source record: 207859

The authors of the Alternate Reality series were a little bit peeved at the way DataSoft treated them and their game system, and weren't all that shy about talking about it..

It seems that "Alternate Reality - The City" was never intended to be released as a standalone game... it was to be the "home base" that you would return to to heal up from adventures in one of the other modules, and to buy and sell treasures, weapons and armor... it was part of the system, but never intended to be an end in itself.

The company wasn't so sure, and released "The City" by itself to test the market... and, what do you know.. it didn't sell all that well, since there was little you could actually do in the game... great sound and graphics, but nothing to do but wander around killing monsters and hoping to join a guild...

Because the first module didn't sell very well, the other modules were never finished for most systems... "The Dungeon" was released on a few platforms, but was never followed up with the other modules...

One of the best gaming systems ever created, now just a footnote in microcomputer history.

BobR

And they've been advertising Falcons too, for about 6 months now. Including configurations that (according to Atari) don't work, eg 8Mb.

I would also try The Atari Workshop (aka Systems Solutions), they seem to be the most reliable Atari dealers.

Source record: 207884

We have a trouble with Atari MEGA ST keyboard.
We can not just call the firm because we live in Russia.
There is a chip inside, and everything goes as it
has been damaged. Its code name is HD6301V1P.
We can not get such a chip, so we need to know
as much as possible about it to replace it by
some equivalent. We know that 6301 is a single-chip
microcomputer with built-in ROM. We need a chip
description and the contents of its ROM if it is
available. Is it possible to get already programmed
one and where?
Or maybe anybody can supply us with description of
Atari Keyboard. What signals go from Atari to keyboard
and back? Is it compatible with PC keyboard?
Please, help us!

```

Well, the higher resolutions work together with all programs which support higher resolutions; these should be all programs that run on the Falcons standard 640x480 resolution. Any other programs (especially games) won't use any other resolutions than the one they've been written for.

But give it a chance. The current one-off price of a 200MHz 21064-AA is around L1700 (US$2500), but that will drop sharply. Remember that the 68000 was a workstation processor when it first appeared - now it's barely enough for a games machine (A600, Sega and Nintendo all have extra hardware). I would expect to see the first Alpha machines used by serious home enthusiasts (the kind who have an A4000/Quadra/486DX now) by late 1994, probably in the form of PC replacements running Windows NT, or possibly Unix machines. DEC's biggest potential market is power PeeCee users, who would otherwise be after a 586 or Pentiwhatsit, and it is in Microsoft's interest not to be tied to Intel forever.

Hi!
On the subject of Civ (addictive game or what?) Have any MSTe owners
found that it crashes if you're not in 8MHz mode?

Well it does for me!

Annoying, but I'll cope.

David.

5042. joysticks was(wht we should prepare for)

Newsgroup: comp.sys.atari.st
Date: 1993-04-06 13:53:45 UTC
From: msteve@magnus.acs.ohio-state.edu
Message-ID: <1993Apr6.135345.10766@magnus.acs.ohio-state.edu>
Source record: 207869

This joystick thing, got me thinking, well, most of us know that the joystick doesn't use all of the locations, I mean, anyone who has used the numeric keypad can deduce this, adding more buttons is a hardware problem, and THEN a software problem.

BTW, In some atari mag, they showed a joystick for the falcon that had 12 buttons... Those are more than fingers on both hands, I guess if I get one, I will have to practice using my toes too.

If somebody really wanted to use two, three, button joysticks, they would write the software for one, a program that will use 1 or as many buttons as needed and attach a txt file on how to make one or modify some existing two button controller. Hey, Atari wont do it, so let some other entrepreneur get his/her hat into the ring...

If there is no demand, there is no supply, it doesn't work the other way around...

Michael Steve
Columbus Ohio

5043. Re: And the Falcon 040 ???

Newsgroup: comp.sys.atari.st

From: ritz@ritz.mordor.com
Message-ID: <9304051492@ritz.mordor.com>
Source record: 207870

mor@gla.ecoledoc.ibp.fr wrote:

: Atari seems to be OK... So, what are the news about the invisible Falcon 040 ?
: Some persons in France say that the Flacon 040 will have a 040 CPU at 32 MHz
: frequency with perhaps one DSP (92001) or two (56001), and full 24 bits graphic
: mode. It 'seems' to be great !

: Perhaps it has been shown during the CeBIT, but hidden, only for devs, only
: for their eyes...

The problem is that even if they did have such a machine, it is questionable
that they can (1) produce them in quantity or (2) sell them cheaply enough
to snatch market share from the "big boys". With Atari's past reputation
dragging it down by the throat, they will have to come up with a mighty
big surprise to stay alive. In the days when 68030 Macs cost as much
as a small car, this might have been possible, but those days are long
gone.

Chris

5045. Re: 520 STFM price cut in the UK (a re-introduction)

Newsgroup: comp.sys.atari.st
Date: 1993-04-06 14:21:38 UTC
From: wmtwen@rw8.urc.tue.nl
Message-ID: <wmtwen.734105778@rw8.urc.tue.nl>
Source record: 207873

Hey, that is good news. I am sure that at these new extra low prices I can convince some of my friends who are getting more and more enthousiastic about this Atari I have and the nice games you can play on such a simple system. By the way the claim that there are less games developed for the ST may be true, but there are still more games produced that I would like to have than that I can afford to buy so I see no problem there. I think that the step is very logical. While the Falcon is still too expensive for most people compared to the prices that one had to pay for the 1040 STE there is still a need for cheaper entry models. It just makes for a completer range of systems. I wouldn't expect Falcon systems (the 1 meg model) ever dropping below 300 UK pound so there is still a need for these cheaper models if Atari wants to cater the home users market.

Erlend.

5046. hard drive options

Newsgroup: comp.sys.atari.st
Date: 1993-04-06 14:23:45 UTC
From: msteve@magnus.acs.ohio-state.edu
Message-ID: <1993Apr6.142345.11252@magnus.acs.ohio-state.edu>
Source record: 207872

Well I'm interested in finding out my options for getting a hard drive. I have been looking at HD's in the atari magazines, but they seem pretty high in cost.

At the Atari club I go to, a member commented that one option was to get some other brand of HD, and get something called a 'skuzzy' controller (I believe that is what he called it). He said that this option would allow me to direct connect the HD to a falcon if I ever upgraded.

I am thinking of going into midi, and that in itself is going to need a 100meg drive at least. What HD options do I have, and what exactly is this controller? Keep in mind, mind you, that I am on a tight budget, but so is everybody else nowadays...

Nice, a port of mg2a for the atari. But what exactly is mg2a? What can
it do for me and what resources does it need?

Erlend.

5048. For sale: 42MB hard drive (UK)

Newsgroup: comp.sys.atari.st
Date: 1993-04-06 14:41:32 UTC
From: dan@uksr.hp.com
Message-ID: <C52GtF.AH3@hpwin052.uksr.hp.com>
Source record: 207876

```
printf("Hello World,");

I have a hard drive for sale. It's got about 42MB formatted capacity. It
works fine with my Atari 1040STe, and I'm selling it for the amazing low
price of #130 (UK pounds sterling). I'm selling it because it's too noisy
for my home MIDI studio, so it's no good to me. It's also a bit big an'
heavy, really. But if you want an adequate disk drive nice an' cheap, let
me know.

UK - Surrey/Berkshire area.

5051. computer baseball

Newsgroup: comp.sys.atari.st
Date: 1993-04-06 16:39:42 UTC
From: pb6755@csc.albany.edu
Message-ID: <PB6755.93Apr6123942@thor.albany.edu>
Source record: 207794

I am looking for a good computer baseball game that can be played on a 520ST with a black-and-white monitor. Preferably, it would be simple enough that a bright (and eager) 8-year-old could get the hang of it. Any recommendations? Please post them or send email to pb6755@csc.albany.edu - and thanks in advance.

5052. Disk Drive Wanted

Newsgroup: comp.sys.atari.st
Date: 1993-04-06 16:46:22 UTC
From: rhett@bigwpi.WPI.EDU
Message-ID: <1psc4u$qme@bigboote.WPI.EDU>
Source record: 207879

I am need of a new disk drive for my Atari 520st.
Its the old kind, no built in drive and the one I had, believe it or not,
was single sided. Well, now it is dead so I need a new one.
I would like to have a double sided drive (wow, moving into the future)
and was hoping I could pick up a used one for $30 or $35 (I've seen them
advertised on here for that before). If thats unreasonable, I understand so
if anyone has an offer I'll entertain it at least, its just that i'm a po'
college boy, so I'll go for the best bargain.
Thanx for hearing my pleas. I miss the use of my ST and I really want to
set up my MIDI studio.
Thanks again.

------======<<<<<<(((((  )))))>>>>>>======------

Got hardware and software you don't use anymore?

------======<<<<<<(((((  )))))>>>>>>======------

Got enough money that you can afford to be generous
with that which others can put to good use?

------======<<<<<<(((((  )))))>>>>>>======------

I am co-chairman of the "PTF Education Committee" (PTF is
Parent-Teacher-Fellowship) for a private, non-profit, Christian elementary/
middle school in Cedar Rapids, Iowa.

The school's name is Isaac Newton Christian Academy. We are working
on putting computers in the classrooms and some in a "lab".

We ask that if you have ANY *Atari ST* hardware/ software items,
partial systems, or complete systems, you would SERIOUSLY consider donating
these to our school. Even if it is an item that needs repair, we'd be happy to
accept it IF we know the repair costs involved before it is shipped to us.

REMEMBER... this is a BONA FIDE non-profit organization!

Thank you for your consideration and support,

Bruce Rothwell

>

Well my brother had a Golden Image opto-mechanical mouse and it died after
about a year of use. He really liked it but wasn't impressed that it was glued
together (making it difficult to service). Both he and I have recently gotten
Beetle Mice and are very happy with them. Time will tell how well they hold
up.

Bob

do that.

Sorry, but the original article was concerning Atari's poor showing in
U.S., not in Deutschland, where it apparently is doing fairly well. It
may be up to 2 months or more before Falcons are available for ordinary
consumers (non-developers) here, possibly at a cost more than an entry
level Mac. I've owned nothing but Atari computers for twelve years,
but
I have serious doubts the Falcon's viability without any changes in
Atari's
U.S. marketing strategy. My German just isn't good enough to buy

software
with manuals written in the langauge of some of my ancestors.

5056. Atari ST stuff for sale: Okimate 20 printer, Printmaster Plus S/W

Newsgroup: comp.sys.atari.st
Date: 1993-04-06 19:47:39 UTC
From: georgew@tekig1.PEN.TEK.COM
Message-ID: <9469@tekig7.PEN.TEK.COM>
Source record: 207888
Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other

Printmaster Plus program for Atari ST $10
Make signs, greeting cards, etc. Works with 9-pin printers and Okimate 20.

Okimate 20 24-pin color printer $40
My kids used this a lot for color screen dumps when they were younger, but they're into DTP now, so I bought a 300 DPI printer. This is the Atari ST version of the printer, which emulates Atari SMM804 graphics (basically Epson 9 pin) as well as doing color screen dumps and 24-pin NLQ text. Included: 2 1/2 black ribbons, 1 1/2 color ribbons, and about 250 sheets of fanfold paper. Doesn't include printer cable, since it uses a standard Centronics cable - about $10 from any computer store. Also, the current print head has one of the 24 pins burned out; new ones cost about $20 by mail order and just snap into place. I'll enclose an order form from the company that sells paper, ribbons, and print heads.

All of the above come with original boxes and manuals, and I'll pay shipping in the continental U.S. (Extra charge for COD.)

I'm Sure Geordi would appreciate a proper spelling of his name (even if it
is April 1st).. Of course, I probably just put my foot in my mouth by
spelling it wrong..

However, Gordy would be pronounced GORD-EE (as opposed to GORD-ON).
You need the e before the o to make the g soft.

Remember Sesame Street? G...Grover... G... George.. I love that skit :-)

I have a Mega STe, 4 megs color system. I want to digitize sounds for use with Superboot, Digivec, and other programs that can use digitized sounds.

What hardware/software will I need to do this and what is the cost of the various options.

Too bad Atari didn't include sound input on the STe's along with the RCA output jacks...sigh.

Thanks,

Spectre GCR for Sale $275.00

Complete GCR Cart., MAC ROMs, Apple System Disks, GCR disks, Drive cable,
and Manuals (ver 2.1) and Supplement for version 3.

Got a good deal on a MAC SE and haven't been using the GCR since, So I guess
I'll sell it. Worked perfect on my MEGA and STacy. Didn't read MAC disks
on my TT, but I didn't even try any adjustments. I haven't seen on the net,
if disks reads work on the TT, but I booted it off a SCSI Syquest that I
swapped between the TT and the SE. It ran EXCEL, WORD... I didn't find
anything it didn't work on. I have a LEMMINGs demo that worked on it.

Email me, if you are interested

A couple of things...

First of all, I've been trying to get GDOS working, but I can't. Does anyone have an assign.sys file that works that they would be willing to email me? Just like a skeleton file with no fonts, but the proper headings...also can anyone send me an Epson 9-pin printer driver? Mind you I don't know if this is possible, so just let me know!

Second, I have been trying to use YMODEM on the Uniterm program to get files from my UNIX account...it has sz, sb and all of that, but I can't seem to get it right. I think the problem comes when I try binary files, I use sz -b <file> but alas...nothing (just errors, that is).

Any help is appreciated...

Hi everybody!

I am looking for a terminal program for the ST, as follows:

- free. I can't afford commercial software right now.
- run on an *old* 520ST. I had to install the TOS in ROM's myself on this baby, and waited a good while before I could even get them. I have not since updated the OS, so it's oooold..MONO
- run off of one 360k diskette...thats all I got.
- have good (this is really important) vt100 or better emulation. I don't need fancy dialing directories or anything like that...its a hardwired connection at max speed possible.
- ooor...KA9Q??? I think that's been ported to the ST. IF someone could point me in the right direction...

Thanks for any help you can give me....

So, the question is... Centris 650 or '486 with OS/2? It's really
looking like Atari's pulling their typical "lead 'em on 'til they die"
routine.

The Mac Centris 610 is the first '040 machine under $2000. "Power
without the Price!" I guess the Falcon030 is the first 16Mhz '030 to
take over a year to hit the stores...

Source record: 207752

Well, living in the US, I'd say the gloom and doom is in order. But the Falcon did get a good review in Electronic Musician, and GenEdit for the Falcon was part of a survey over different platforms in last month's EM, I think. So there is a certain Falcon presence in the music world. I'll probably buy a F30 if/when they become available even though I'd prefer a 40 (I'm used to '40 VME boards now) because who knows if a F40 will ever happen. But an F30 is a hell of a lot better than my 1987 1040ST which I still prefer to a pc. And I can always play with Suns and SGIs in the lab :-)

Atari still has a presence in the music world, and that is the reason I bought the damn thing in the first place.

>The May issue of ST-Format landed on my doormat this morning ...

I'm curious, which one did you pick up first and try to read? :-)

> ... and its front cover declares that Atari have announced a re-introduction
> of the 520 STFM at a new price of 159 UK-pounds, a reduction of 90 pounds.

I heard that a bunch of STFMs were _discovered_, stocked up in a foreign subsidiary and these are the ones now being sold (w/ UK ROMS). 50:50 chance of being the truth I guess. Since the price of a new STE is £250 then I don't think a £160 STFM is much of a reduction. Say £30 maybe.

> Here's a few snippets from the atricle:
> "Atari are bidding to rejuvenate the ageing STFM by dropping its price to a
>staggeringly low 159 pounds - and it is strongly suspected that the firm will
>also be dropping the prices of its STEs later in the year.
> The manufacturer stressed that the new move is not a price drop but a
>"re-introduction of the machine at an ultra competitive price point."
>Atari believe that at its new price the STFM can recapture some of its old
>glory days and hit sales of 150,000 units in 1993.

There must be some serious drug taking going on in Slough.

> Atari's Marketing Manager, Darryl Still, told us that they had considered
> dropping the eight year-old machine altogether but decided on a revamp due
> to perceived demand from retail.

Ah yes, Darryl Still. The man who obviously wears a red nose all year round.
Did anyone see his massive Falcon TV advertising campaign at Christmas?
No and neither did anyone else. Commodore, wrongly anticipating an agressive Christmas Falcon marketing campaign from Atari, went all out with an Amiga campaign. The bulk of the Christmas market went to the consoles but Commodore were there as the only alternative if you wanted a games computer.

Note that's a 'perceived demand' not an actual demand.

>New, cheaper production techniques are being used to manufacture the new
>batch of FMs.

Finding them in a magic warehouse is certainly a cheap way to manufacture computers. It would be interesting to see the chip dates and board revisions on these machines.

> This makes the low price point possible but also means that the
>machines will be extremely difficult and costly to upgrade. Still described it

>as "definately a workshop job."

He's a workshop job.

> He went on to explain Atari's rationale behind the introduction: "The plan
>was for the FM to be superceded by the 520STe. We intended publishers to write
>to the 'e' and produce a software base that was even more impressive than the
>Amiga's. Unfortunately, publishers didn't do that, they continued to write to
>the base machine."

Mostly because of compatibility. Not only that but Atari kept taking features
out and putting features in all of their new machines. If developers used
the BLiTTER in the STE then they wouldn't have it in the TT. Same is true
for the analogue joystick ports which have resurfaced in the Falcon.
Do MegaSTE's have them? Also Atari never really stir up a fuss over
incompatibilties. It's their own fault.

>other quotes: "....it will definately put pressure on consoles like the Mega
> Drive and Super NES."

Pfft! The Atari ST section in any game shop is the smallest part if it exists
at all. In the past year we have seen Sega and Nintendo wipe the floor with
computers as game machines.

> "....it gives the consumer the option of a real computer for the
> same price as a console."

It stiffs the consumer (god I hate that word) for 160 quid for a computer with
no support and a software library that is shrinking on a daily basis.

> "....(Darryl Still) I think the new price gives the STFM at least
> another three or four years of very healthy existence."

Is 'being a total arse' part of the qualifications you need to work for Atari?
Personnel: "Have you any marketing experience?"
DS: "Nope!"
Personnel: "Do you know what a computer is?"
DS: "Uh ... someone who travels to work?"
Personnel: "Can you start Monday?"
DS: "What day is this?"

Back to Grant:
>I just don't know if this is a good move or not by Atari. They claim that this
>is "no panic measure, no last stand" but I can't believe that.

Me neither. I suspect that if they ever start to market the Falcon they
will be pitching the STFM, and probably any STE's lying around, as what to
buy if you can't afford the Falcon. Ignorant buyers will not be aware of the
vast difference between the machines. Although you'd think the price would
be a dead giveaway. Serious purchasers will not be taken in but Atari will
sell quite a few of these STFM's for sure.

>I have watched the number of new Atari software titles drop to a
>trickle compared to the Amiga and PCs.

The Amiga section in my local Virgin store used to be the biggest now that space is for the PC software. I think Commodore are similar to Atari but are just not so advanced in their state of decay.

>They showed an interesting graph which claimed that in 1992 in the UK, the
>ST claimed 5.7% of all software sales, with the NES at 4.6%, Gamegear 4.4%,
>CPC 3.9%, SNES 3.7%, PC 3.3% and Lynx 0.7%.

What's the source of this info? I think the PC figure is low, the Lynx is way too high and where is the Amiga?

>Whad'ya reckon Guys??

I reckon Atari are squirming, belly up, in the sun.

Nope !! Darryl Still said that Atari do not have a warehouse full of STFMs somewhere. In fact, Atari are having to manufacture the new FMs from scratch and to be able to meet the new price point the manufacturing technique is such that it will be very difficult to upgrade them. I really don't know what they could do to make it so difficult. If we are talking about memory upgrades then I reckon I had a pretty hard DIY job when I upgraded my STFM up to 2 Megs, the most difficult part being unsoldering the video shifter chip and soldering a socket back on. Not having much experience with a soldering iron didn't help and I thought I'd toasted the chip and shorted a track but everthing went OK. So, I don't know what they can do to make it harder. Maybe the MMU will be surface mounted with no socket for piggy backing, that would be a bitch.

Anybody got any ideas how the new FMs could be made difficult (next to impossible) to upgrade ??

Grant.

I am looking for the following items:

Cheap ST hard drive or info on buying a used one and controller.

External floppy drive?

Something to put in the cartridge port! Deskcart? almost anything
would be useful or just something to toy with.

Cheap Midi Cables...

Cheap color monitor

Maybe even a cheap plain text printer.

Anyone selling a TOS extention card (codehead tech.) ?

Accelerators?

I am also looking for some software:

Chaos Strikes back! (the sequel to dungeon master, I have DM, but want
the sequel)

ST Talk PRO 3.0! (not the demo version on a.a)

Star glider II

As you can see I don't really want to spend alot of money. I am just
interested in slowly building my system up to something more and more
usable. If I find something for a good price, then great, if not oh
well.

Any replies Email.

From: rh@dmu.ac.uk
Message-ID: <1993Apr7.104721.8881@dmu.ac.uk>
Source record: 207760

etlgtme@etlxd20.ericsson.se (Grant McFarlane) writes:

> The May issue of ST-Format landed on my doormat this morning and its front
^^^^^^^^^
In my experience with this magazine, you can tell them anything and they'll print it - even if it was only a casual comment over the telephone. I'm not saying it's not true but I am always sceptical of their "hot news" items.

> "Atari are bidding to rejuvenate the ageing STFM by dropping its price to a
> staggeringly low 159 pounds - and it is strongly suspected that the firm will
> also be dropping the prices of its STEs later in the year.
> The manufacturer stressed that the new move is not a price drop but a
> "re-introduction of the machine at an ultra competitive price point."
> Atari believe that at its new price the STFM can recapture some of its old
> glory days and hit sales of 150,000 units in 1993. Atari's Marketing Manager,
> Darryl Still, told us that they had considered dropping the eight year-old
> machine altogether but decided on a revamp due to perceived demand from
> retail.

I believe that some ground could be recovered if the entry machine was **1Mb**
Atari should have dropped the 520 a long time ago - now I fear it is too late.
The other machine we write software for (the Amiga I'm afraid) has now basically established a minimum spec of 1Mb for almost all recent software. This allows a much greater freedom for developers to create better quality software without losing most of the potential market.

> He went on to explain Atari's rationale behind the introduction: "The plan
> was for the FM to be superceded by the 520STe. We intended publishers to
> write to the 'e' and produce a software base that was even more impressive
> than the Amiga's. Unfortunately, publishers didn't do that, they continued
> to write to the base machine."

True enough, the retreat to the 'FM' model probably won't make any difference. This could well be because the extra custom chips (blitter & sound DMA) on the STE never really compared to their Amiga counterparts anyway:

- STE blitter does not have the same multiple sourcing facility as the Amiga
- DMA sound is only 2 channel
- DMA sound has restricted playback frequencies, so *lots* of processor time must be used if frequencies other than 6,12,25,50KHz are needed.

So therefore I don't think the STFM thing will have any bad effects at all.

This is *not* an Amiga vs ST thing - we have both Amigas and STs and for most of the time I have preferred to use the ST, but now Atari seem to be driving themselves into a big hole. At the moment, we have moved to developing for the Amiga only. It will take some improvement or sign of hope in the Atari

market for us to return at this time.

> "....it will definately put pressure on consoles like the Mega
> Drive and Super NES."

> "...it gives the consumer the option of a real computer for the
> same price as a console."

People will still buy their kids a console because all their friends at school have got one. A lot of people don't actually want a computer - they want a cheap machine with lots of glossy commercial games. If you can't afford the 65 pound cartidges then you can buy an (1Mb) A500+ (many places still have new ones) for 199 pounds and get a "real" computer with console quality games.

> "....(Darryl Still) I think the new price gives the STFM at least
> another three or four years of very healthy existence."

Is this "very healthy existence"? I am saddened by how quickly the Atari range has "fallen from grace". It used to be my favourite machine (over the Amiga) - no more.

> They showed an interesting graph which claimed that in 1992 in
> the UK, the ST claimed 5.7% of all software sales, with the NES at 4.6%,
> Gamegear 4.4%, CPC 3.9%, SNES 3.7%, PC 3.3% and Lynx 0.7%.
> ^^^^^^^

Hmmmmmm - sceptical. PC simply must have more software sales than any other platform. In the games world, Amiga games sell about 5:1 to ST games.

The Atari range are still fine machines (assuming Atari will get their act together) and they have a firm place in my heart - I really would like to see them get back on track. What they are not at the moment is an anywhere near significant competitor in the games market, which seems to be the target for this rumoured latest move - and they won't be with a re-boxed 8 year old machine against the fast moving $$$ grabbing console companies.

Well, that's my peice.

Greets,
Firstly thanks to those people who gave me an FTP site for powerdos.
I've now got the problem of no doc's (From what I've read this is right) and
PDEXPERT2 Keeps giving me a 'Val string error' or 'Val String wrong lenght'
error. There was no CONFIGUR file, can you help.

So far, I've tried to run Powerdos from the AUTO folder, but without a
CONFIGUR file no joy.

If someone could tell me the format of the said file, or even mail me
one, I'd me most greatful.

In article <bg258s1421.03a3@sycom.mi.org>, bg258s1421@sycom.mi.org (Burley Good) writes:
>I am looking for an inexpensive HD a starters HD. I am looking for a used
>maybe 20m or more CHEAP!!!

You might want to try rolling your own. It is very easy for the ST. You
need:

A host adaptor
A power supply
An enclosure
A SCSI drive

I recommend the ICD Host adaptor. It has (IMHO) the best software, which is
updated frequently (and available free). They also provide a very easy way
to add a battery backed up clock to your ST (if you don't have one already,
they can be bought with or without the clock). I also like ICD's because they
report any "sense codes" the drive communicates to the user. I have only
seen one ("read error with recover", induced by dropping something heavy on
the desk while the hard disk was reading), but I find it reassuring that
any weirdness at the device level is reported directly to me (it pops up in
the corner of the screen, by the way). Price is about $80 at last look.
Without the clock, you save $10. Order the SCSI connector cable where ever
you get the host adaptor, and make sure to ask for a dual drive one with a
red wire denoting pin one (to make the installation easier).

Power supplys are cheap. Just pick up an old XT power supply for ~$30 from computer shopper. If you can find a junked PC, you can get one for free.

Enclosures can also be cheap. You can buy one of those huge old style XT cases for about $30 from computer shopper. This will hold all the hard drives you will ever want! Buy a tower stand for $5 and stick it on the floor (the ICD cable is nice and long for this). You can also go all out and buy an enclosure which will fit under your monitor (mine houses 2 5.25" devices, has a front mounted lit power switch, mates perfectly with the ICD board, etc) with power supply for about $125. There are several places that sell these for the ST, two being Toad Computers and D&P Computer Supply. Email if you want their 1-800 numbers. Again, a junked PC is the absolute cheapest way to do this. If you can get ahold of granny's old IBM XT, you are in fat city. A nice side bonus is that the old PC motherboards make great wall hangings (big fat traces, lots of chuncky looking components). Old PC's are really easy to find, now that everyone is going to 80x86 machines.

Now, the SCSI drive. These can be bought from Computer Shopper. All you need is a bare SCSI device, no other boards or anything. The ICD host will work with just about anything, but there is a very large list of already tested drives that comes with the host adaptor (which I could probably email to you also). Drives are very cheap nowadays, and if you want to really save money you can get a refurb. Several of the refurb places will guarantee their drives for X number of years (X varies with the particular company), so they can really be the way to go.

Anyway, you will now have your hard disk. You bolt down the drive and host adaptor (you can drill some extra holes in the case, or use wire-ties or whatever), connect the two, plug in the power cords (the ICD comes with a little splitter which connects to a standard PC type power cord), hook up the DMA, and boot up. It is very simple, and is not easily botched up. You only need to pay attention to:

SCSI id jumpers set to some reasonable value
SCSI terminator pack plugged into the drive
SCSI connector from drive to DMA is right side up on both ends
Nothing wiggling around

The first two can be checked via the manual that will accompany the drive (make sure you ask for one, some places assume you already have one), usually a 1 page Xerox. The third can be verified by checking that the red wire side of the ribbon cable is near pin one (which is marked on the board either by a number or by a square solder hole instead of a round one). If the cable is in backwards, the red end will be at the other end of the connection (quite often it is pin 2 that is marked, but you only need to know which end of the connector the numbers start on, and match it with the red wire). These are the only two possibilities. You cannot mess up the power connections or the DMA connection (they won't go in wrong).

The reason you wanted a dual drive cable is so you can easily add another device in the future. You merely have to plug it into the other receptacle on the cable, remove the terminating resistor pack off the middle drive on

the cable (the one on the plug closer to the computer), and check to see that the SCSI id jumpers are set to two different numbers. Oh, by the way, the ICD supports the Syquest SQ555 (the 44mb removable cartridge drive) without any special concerns. Since the Syquest is a SCSI device, you can hook one of these up just a easily as you could a regular fixed disk drive. These only cost about $320 bucks nowadays, with 44mb cartridges going for ~$60.

It really is easy, and there are plenty of computer tinkerers around to look over your shoulder and verify what you do. You can also use a setup consisting of a host adaptor, SCSI controller board, and ordinary PC type hard disks, but you add complexity to the system and lose performance this way. Straight SCSI is much cleaner, and usually much faster (SCSI devices have their controller boards "built in", communicating with the SCSI standard).

If you do get a hard disk, you should immediately buy Neodesk 3 and the Universal Item Selector III. They will make life much nicer. Also, beware of buying too small a hard disk. Megabytes are like potato chips. I have a buddy with a 105mb quantum drive, a 320mb Hitachi, and a Syquest SQ555 with 6 cartridges all hooked to his ST, and he still complains about not having enough disk space! I have not yet gone that apeshit, but I think Mr. Visa might have to talk to Syquest Corp. pretty soon. Oh, notice the my friend above has three SCSI devices hooked to his ICD. This just requires a 3 plug cable. The ICD can support 8 SCSI devices, and you can hook up multiple host adaptors if you really need to (like if you get given a box of 10mb SCSI drives :-).

Please feel free to email questions. The above is IMHO, direct flames elsewhere.

I use xmodem (which also does ymodem-batch) on the UNIX end, and Uniterm
at home. Never had a problem. Xmodem is available in many places, use
archie find a specific one. BTW, in this case, xmodem refers to a particular
binary, not the protocol in general.

I generally do an "xmodem sbcykl filenames" on the UNIX end. That is,
send binary CRC ymodem-batch 1k-blocks no-log-file.

I'd suggest using uniterm 2.0e, which is pd. Yes, there is a version of
ka9q for the ST and its available at atari.archive.umich.edu, I believe.
Follow the instructions carefully, and put the config files where they belong
or it won't function properly...

Later,
Bernard

Baaahaaahaaahaaaa haaa haaa haaa whimper sob sobb...
This is so totally stupid it's hard to believe. The STFM. For god's sake.
16 colours, no blitter, and no new software. And crap sound. I give up.
Can't they see the reason the Amiga did so much better for games was
1) 32 colours
2) sprites/blitter
3) good sound
all of which are impossible on the STFM. PUSH THE STE!!!! THE STE!!! Destroy
the STFM's! Land fill!! ahem. Even with 16 colours, the STE would have some
kind of chance.

> He went on to explain Atari's rationale behind the introduction: "The plan
> was for the FM to be superceded by the 520STe. We intended publishers to write
> to the 'e' and produce a software base that was even more impressive than the
> Amiga's. Unfortunately, publishers didn't do that, they continued to write to
> the base machine."

That's because the STE, like everything Atari makes, was TOO LITTLE TOO LATE.
Nice hardware, but late. It would've been a real good race between the
STE and the Amiga 500 if the STE was shipping in volume a year or two earlier.

> other quotes: "....it will definately put pressure on consoles like the Mega
> Drive and Super NES."

What a pathetic joke.

> "....(Darryl Still) I think the new price gives the STFM at least
> another three or four years of very healthy existence."

Well there you have it, these morons are both blind and stupid. They should've
dropped the STE price to nothing years ago and really pushed developers with
good tools.
They're doomed.

This would be an interesting project, if someone would go ahead and do it.
The Sega Genesis controllers can be used right out of the box, but only the
[A] button works as fire. It would be neat if someone would find tou if it
would only take a software or hardware solution to use the other two
buttons and start.

(BTW, I saw in one of those video game magazines that Sega is developing a
device that plugs into one port and allows up to four controllers to be
plugged in.)

>
>Anyone know for sure?
>
> -Matt
With PageStream 1.8, the minimum you need is the .12H, .FM, and .DMF (or the proper .PS and .PSF files). With versions 2.1 and up, you can either use Compugraphic fonts, or you can use Pagestream fonts. 2.1 and up only require the .DMF files (although it seems to be a little faster if you use the other files, too).

Your solution? Pay Soft-Logik the few (I think it's either 30 or 50) bucks for an upgrade to 2.2. It's well worth it... (You DID buy the program, right???). Good luck!

Hi,
Yes it's quite cheap, but it has no FPU, right ? So a lot of power-
hungry task like for example raytracing will not benefit from the '040,
because to get it to work with a FPU version you need an emulator like
SoftFPU or something like that, that really makes the machine slower than
an '030/'882 combo.

Kind regards,

Michael Franke (franke@cs.tu-berlin.de)

The 68040 has both an on-chip MMU (PMMU) and an on-chip FPU (PFPU??? :-).
The on-chip FPU is much like the 68882 but I believe some commands are left
out. Anyone know for sure?

It is my understanding that the FPU inside a 68040 does calculator
arithmatic: +, -, *, /. The rumored 68060 is supposed to have a much
more elaborate FPU built in.

>without the Price!" I guess the Falcon030 is the first 16Mhz '030 to
>take over a year to hit the stores...

First crippled 040 to be under $2000. And anyway, your probably wrong
there as well. Last year NeXT had a two week blow out sale on educational
NeXTStations...and I think they were ~$2000 *with* monitor.

Oh, so you are conviently assuming the SE/30, LC, and Classic two took
less than a year to hit the stores. Considering Apple's past record,
you are probably wrong about the SE/30 and the LC. But they are much
better at blitzing the stores with new models now, so the Classic II
might actually have beaten that.

I think the biggest problem Atari has is that Atari users *demand* info
once a little rumor gets out, and Atari lets some information go to
appease them. Then, since it's early information...and it goes wrong
we all cry "Foul!".

I've been waiting on the DSP macs for more than a year now. I've been
awaiting the release of 0S/2 2.1 for awhile also. Considering the hype
about NT I would have thought it have taken over the world already
(like Microsoft said). Atari is far from the only computer company
that has let a release date ship. In fact, it's hard to find a company
that *meets* shipping dates...unless they keep the product under compleate
silence right up till release!

I've had great experiences with Toad's mailorder... They can be reached at
(800)448-TOAD (orders only), (410)544-6943 (Info--very helpful), or by FAX
at (410)-544-1329. You can also try a number of other dealers, such as
ATY Computer in Oakland, CA (call 510-555-1212 for the number), Computer
Studio in Asheville NC [mentioned above] at 800-253-0201 (704-251-0202 for
info), and others (I'd list more, but all I have here is a Summer 1992
Current Notes, so I don't know which of the places listed still exist).

If only I could find one in Manhattan (or at least in Bklyn, Bronx, or
Queens, near the Subway)... :-(

I recently bought an Alfa Data mouse and found that it drifted quite
badly when using CUBASE (a good quality package). I have tried keeping
my hand on the mouse when it drifted and would swear that the mouse
hadn't physically moved. I thought about taking it back to where I
bought it but, if anyone else told me this, I would not believe them.

If you ever find out WHY we get this movement, please let me know.

The Falcon's mouse is the same as ever. But I wouldn't say it's too slow.
Just use the XControl's mouse accelerator that comes togehter with every
TT, STE or Falcon to speed things up.

From: sbyec@westminster.ac.uk
Message-ID: <1993Apr8.101827.3151@westminster.ac.uk>
Source record: 207931

I have brought in PD, Modula 2/68 for the ST from Ana Systems of Forster City California. The date on the software is about 1989 - 1990. The thing is, it has no documentation about the libraries, even though the release notes claim thorough documentation and 250 pages of library descriptation. The atari specific libraries(display, using GEM,etc) is VERY INCOMPLETE!!! and lacking in any documents.

So does anyone know of :-
1) Documentation for the above Modula 2
2) A decent Modula 2 complier with the full docs and full Atari/Standard Mod2 libraries.

Thanks in Advance
Russell Hempel

Could any replies be e-mail to sbyec@uk.ac.westminster.

Yes, it comes with the lovable atari mouse, but atari say that you can use
higher definition mice instead (I assume this means the optical kind or
higher dpi types). They supply a mouse accelerator to start with anyway,
one of the few useful things in the startup package!

Are you sure it only happens in Cubase? I think that wandering mice are quite
common, and the problem is still there whatever program(s) you are using.
My official Atari, straight-out-of-the-box mouse had this problem,
every so often it would decide to head off to the top of the screen. Great
fun if I happened to be playing Lemmings at the time.
I heard that the problem is due to electrical noise, and can be cured by
soldering a capacitor across the the power lines of the IC inside the mouse.
I didn't bother, I just went a bought a new one. Only 8 quid, higher res,
works great with no wanderings.

Regards,

Hi everyone,

I'd like to buy a new monitor for my old, trusty STE. Now that the ATARI favorites
SM 124 etc are out of business, someone suggested to me just to take any
black and white VGA monitor and all I needed to do was make a new plug
so it will work with my STE.

Is anyone out there who can tell me it will definitely work (or not)
and maybe point me to a good choice of monitor?

I only want B&W, I have Color via a second Monitor.

Thanx in advance!
Doro

My guess about vibrations being the source of the drifting is that it occurred when the floppy was accessed, and that I could get the drift by drumming my fingers on the work area. Even if you put your hand on the mouse, either the mouse ball or the wheels inside may still be able to move.

CUBASE perhaps accesses your floppy in a way that causes the best vibration pattern for causing drift.

|> If you ever find out WHY we get this movement, please let me know.

I'll stick with vibrations causes the wheels within the mouse to drift. I got this with the old Atari mouse as well, only not as badly (I chalked up the increase in drift to the higher resolution of the Alfa Data mouse).

Two fixes that pop into mind are getting a more solid work area (mine is a cheap computer desk) or setting the computer unit on top of one of the big pads (just like the mouse pads, but six times the size); or doing something to the wheels in the mouse that prevents drifting but still allows response to mouse ball movements (that is, I think these wheels are too freely mounted).

5138. HELP: Displaying 3D objects in world

Newsgroup: comp.sys.atari.st
Date: 1993-04-08 13:48:38 UTC
From: esuoc@csv.warwick.ac.uk
Message-ID: <1q1afmINN2jt@violet.csv.warwick.ac.uk>
Source record: 207920

Hello,
I'm creating a Virtual Reality Engine on a SUN SPARC ... I've managed
to program he whole 3D graphics engine in C++ ... and works amazingly
fast!
The problem is displaying objects using the "painter's" method; where
objects furthest away are displayed first etc. It may sound easy but then
you have to consider displaying objects which are above and below, and
left and right.....
For example: Imagine your self above the ground, imagine a cube is on the
ground and another cube just above it....

```
* (viewpoint) | You would need to draw cube B first then
\ | cube A.....
\ |
\ |
|
[ ] (cube A) |
[ ] (cube B)
------------------------------------ (ground)
```

The major headache comes when you have a situation like this....

```
[ ] (cube A) | Here you would need to draw cube A then B,
| then cube D then C.....
[ ] (cube B) |
(viewpoint) |
* ------- |
|
[ ] (cube C) |
|
[ ] (cube D)
------------------------------------ (ground)
```

Can anyone HELP me?????
Thank you!
Ajay (Alias Thor) 8*)

> Are there any GL viewers for the ST ?

No. It would be extremely dificult to write one since most GLs use
256 colors and they would have to be converted to 16 colors in
real-time. (ie. fast enough to look good)
The only way is to convert them to .SEQ or .SPS (Anim) and then
view them. But that takes a lot of work:

GL -> PIC -> GIF -> SPC -> NEO -> SEQ
'-> SPS (Anim)

If you have the time go ahead :-)

Carlos Varela

In the Netherlands there are 2 dealers that have their own Atari compatible monitors. Namely Atin and Dataskip. I think their names are (very original...) Atin SM 148 or so and Dataskip SM147 or so.
You can use the dataskip one with an IBM if you would like to. For the Atin version the changes are internal so it is just an Atari specific monitor.

Erlend.

The original model of the '040 has a reduced FPU set. However, the
'040 in the Centris is the 68040EC which means it is the '040 without FPU
support - much like the 80486SX. If I recall correctly, the 68882 has
several functions not on the on-board FPU of the '040, and can use the '882
much as the '030 does.

In San Antonio, TX there is Starbase Atari which is a computer store
that only deals with Ataris and in Austin, TX Hobbytown and MusicMakers are
both Atari computer dealers. Is anybody keeping track of all this? How many
are we up to now? :-) and do music stores count?

OK, here's what's the deal with the Mac Centris so that you can
compare it to the Falcon, whatever...

The Centris 610 has the 68EC040 (I think the letters might be different)
(What I do know is that it is the 040 without the internal math
coprocessor).

The Centris 650 has the COMPLETE 68040 in it.

If memory serves, the 610 is $US1800 - $US2000. I was never really
interested in the 610 because of the small case.
The 650 however is definitely around $US2500. That I am sure of
since I was pricing it at our campus store (which may be a wee bit more
expensive than, say, mail order)

For those who are interested, the LC goes for around $US1200 and
the IIvx goes for $US1500

The above prices are pretty much the price of the minimum configs.
The more resonable configs are usually anywhere from $US200-$US500 more.

This isn't good because a decent falcon (65hd, 4megs) will go for
$US1200. I think the Non-ATARI-addict will simply see Macs availability
and compatibility and gobble up an LCIII for the same price. Not
to mension the fact that it runs faster, has a bigger hard drive (80megs)
and with 12 inch monitor does just as many colors.

I really hope ATARI can get it together. The 030 falcon is nice for
ATARI addicts or small to midsized music operations but I don't see
Joe Bleux buying it. It seems that ATARI always leaves that little
something in their computers that just keeps them from being in the
mainstream. We can only hope that the FALCON040 is a real power house!

Hopefully we can get things like:
Nice, large case (maybe not a tower but def. box-like).
STANDARD expansion slots and lots of them.
FULL 040
96000 DSP
Full 24-bit color.
32-bit addressing
Higher Screen Resolution (say 800x600x24 bit).

This may be a lot to ask but even with this, man cannot live on
hardware alone! (To twist a phrase!) ATARI needs to get it's
butt off the ground and start really pumping software makers
in the US. They also need to start advertising in bulk. Take out
that full page add in The Times next to Apple's ad. They have to

really go bonzo on their development, software and advertising if they want to be little more than a lame duck in the US and the rest of the World (esp. in Europe where they are losing ground quickly to clones!)

I hate to say things like the above and I used to hate it when the gloom and doomer's would say stuff like this but I think it's time for realism. It's time for ATARI to wise up and not think it's the early 1980's where a computer was a curiosity that everyone had to have. They have to realize that unless they really try hard, the general populace will only buy what they see as stable and sit on that until the next generation when they trade in for the new model of the same. If ATARI doesn't get in now, they don't stand a chance. We are at a crux in home computing that could either save ATARI or destroy it utterly. Remeber, when I say "save" I mean ATARI will live to bring out it's next computer. I don't ever see anybody beating out the clone market or the Mac market simply because those companies are too large and too many for any other company like ATARI with a foriegn archetecture to break into.

Home computing as we know it is going to a point of singleness. No more of the multi computer base from the 1980's will exist. There will be only one, possibly two computing companies that will come out on top. Let's hope ATARI can stick around until then.

Crossing my fingers and hoping

The 68040 has an FPU on-board but it does not include transcendentals (mostly trig functions), which therefore need to be done in software. On transcendentals a 68040 using highly optimized code can run at about the same speed as a 68030/68882. On other floating point code it will be much faster. Supposedly the 68060 (why even discuss this right now?) will put transcendentals back into silicon.

>--Tom.

I have been watching Atari stock for about 3 months and it has been in the
1.25 to 1.0625(1/16) range for a while. moving an 1/8th, losing gaining etc
basically a rather flat stockline, with a slight decline in the moving average
until monday, where it took a hit to 13/16th's or approximately 18% drop

What's up? Does atari actually have any liquidity?

I'm not a stockholder but at 75 cents a share, and the Jaguar rollout
'supposed' to be at summer CES(June) looks like a stock that might move?
or evaporate? but then again you may double your money.

I really wanted to know why it took a hit. Surely not becuase of the
San Francisco Chronicle article that detailed the dropping of the lynx line
[actually that was an april fools joke on alt.games.lynx]

Still inquiring minds want to know.

anyone know, please enlighten me and the readership
-Ajay

5160. GIF VIEWER FOR THE ST.

I have heard from Atari as well as other sources that the Falcons will be shipping next week. Well let's see who gets them first.

bye...

5166. MasterBrowse 2.0 - Suggestions?

Newsgroup: comp.sys.atari.st
Date: 1993-04-09 07:40:18 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.c&fbC8KuTSA@elfhaven.ersys.edmonton.ab.ca>
Source record: 207950

Hi,

I am in the process of updating MasterBrowse. There were some bugs, and I got a lot of ideas after releasing the program. Before I release the next version, I would like to here what other people want in a text file viewer.

Here are some (some!) of the things that I have added to the new version.

[In case you have no idea what I am talking about, MasterBrowse is a text file viewer that was posted to comp.binaries.atari.st and uploaded to atari.archive recently.]

-Thermometer bar progress displays.
-Reverse searching with up to three search strings.
-Window titles can now be set by the user.
-All windows and memory can be freed with a single keypress.
-More informative error dialogs.
-Added an optional extended window title bar format, which shows (instead of just the complete filename) an eight-character filename, the size in bytes, the number of lines, and the number of pages.
-Block markers can be optionally removed after loading a new document, or when a print/write operation is finished.
-The entire file can be marked as a block with a single keypress.
-MasterBrowse can now optionally save the positions and sizes of the first five windows.
-The block functions have been revamped. They now highlight the block using a nice pattern, and the end of the block is marked using the bottom line of the screen.
-The searching functions now highlight the string when it is found (inverse) and display the found line in the center of the screen.
-MasterBrowse now beeps when the user tries to move out of bounds or a search fails.
-Option files can now be loaded or saved at will.
-MasterBrowse can now cycle through the windows it owns, so that access to hidden windows is very easy.
-MasterBrowse can now jump to the last position the search string was found at.
-MasterBrowse now uses 1 as the base number instead of 0.

While I am still working on this version, it would be nice to hear suggestions from the readers of comp.sys.atari.st on what else I should add.

5169. Clock Chip for STe?

Newsgroup: comp.sys.atari.st
Date: 1993-04-09 18:20:40 UTC
From: glennd@pioneer.arc.nasa.gov
Message-ID: <1993Apr9.182040.10737@news.arc.nasa.gov>
Source record: 207705

Does anyone know if there is a clock chip available for the STe that plugs into the CPU chip, similar to the way the Dallas clock chip does on the regular ST? From what I've been told, this clock will not work on the Ste. I'd like to hear about other STe-compatible clocks as well, although I already have something plugged into the cartridge port, so I'd like to avoid those that plug in there.

Thanks.

- Glenn

5170. ADMIN: ftp.hyperion.com unavailable this weekend

Newsgroup: comp.sys.atari.st
Date: 1993-04-09 19:00:41 UTC
From: koreth@spud.Hyperion.COM
Message-ID: <1q4h4p$or@spud.Hyperion.COM>
Source record: 207721
Cross-posted to: comp.sys.atari.st,alt.tv.babylon-5,comp.sources.atari.st,comp.binaries.atari.st

The ftp.hyperion.com ftp site (which houses the official comp.sources.atari.st/ comp.binaries.atari.st archives and a lot of Babylon 5 files, thus the crossposting of this message) will be unavailable until the afternoon of Monday, April 12. Apparently the ftp server we're using has a nasty security hole. I won't have time to install the fixed version until Monday, so in the meantime I'm being paranoid. For Atari users, archive-server@spud.hyperion.com will not be affected by this shutdown.

Sorry for the inconvenience.

-Steve

5171. Apple will revamp Performa line....

Newsgroup: comp.sys.atari.st
Date: 1993-04-09 19:13:15 UTC

Message-ID: <1993Apr9.131315.12208@iscsvax.uni.edu>
Source record: 207711

The Centris 610 has a 20mhz 68LC040. It will still be faster than the vaporware Falcon. The street price is $1650 and $1425 for students, at least at my school.

This Monday(April 12), Apple will revamp the Performa line with new models and configurations. The Performa 400 will have a new price. The P400 with four megs, 80 meg HD, 14inch color monitor, 2400 modem and 9600 fax and software will be bundled for $1349.00....

I bet that the Tramiels were business graduates....That would explain it...

No flame intended....Its time to move on....

Oh yea....Apple has drop the prices on the PowerBook Duos drom 10% to 18%....

Look for more goodies and price cuts starting next month and beyond....

5177. Re:HELP:Displaying 3D objects in world

Newsgroup: comp.sys.atari.st
Date: 1993-04-09 20:43:48 UTC
From: se18@theodosius.cs.qub.ac.uk
Message-ID: <1993Apr9.204348.255@ousrvr.oulu.fi>
Source record: 207710

I agree with you Ajay Soni that the normal 3D pythagoras method
will work in MOST cases, but for the 3D engine to render the objects
correctly in ALL cases for a convex polygon and convex object environment,
a different algorithm or enhancement of the normal Painter's Algorithm
needs to be implemented.

For a 3D game to be 'realistic', objects should always be rendered
correctly on screen. Take for example Mercenary III by Paul Woakes, the
3-D routines in the game were exceptionally good, but did not draw things
correctly when one stood behind a building occassionally and a vehicle was
travelling along the road. The car should not have been seen as it was
obscured by the building, but in some cases depending on the position that
one was behind the building, the car would be displayed when it should not
of been. I believe the problem was his implemention of the Painter's
algorithm.

I am not slagging off Paul Woakes as he is a brilliant Programmer, but I
am just trying to point out that doing a basic Pythagoras is not enough
to develop a reliable 3-D Engine. This mistake appears in many 3-D
games, especially when 3 or more objects are close to each other. When
multiple objects are close and if they are of different sizes the
pythagoras measurements from the camera to the objects can be flawed
(as I am sure you know), causing objects to be displayed in front of
others that they are actually behind in the 3-D View Coordinate System.
This is obviously NOT good enough as the engine must be as reliable as
possible and should not be developed to "Sort of work".

I suppose when I get my 50Mhz Falcon 040 with 96002 Dsp and a
200 Mhz Dec Alpa Co-processor I will have the option of using Octrees,
which will make the whole thing simpler, but until then I am not
quite sure how I will adapt my Painter's Algorithm,

I believe there are a few algorithms that deal with this, for example the
Z-depth buffering algorithm, but this may be too algorithmically expensive
to implement on an STE as I think it runs in O(n^3) time (using Big 'O'
notation),

If anyone finds out how to implement a Painter's algoritm for ALL cases
using convex polygons and convex objects I would greatly appreciate the
information.
Either email it to me or post it would be greatly welcomed.

Nic.......

I like it too, but it doesn't run off a 0.5 MB machine, and if you
intend to stuff it on a 360 kB disk you must pack it and still you
won't get almost anything else on the disk. And it doesn't support
ZModem, it has to use XYZ for that. Nice external protocol interface
though.

Reading compressed text would be nice.
I think the sources for the new ZIP compression are available
as INFO-ZIP and compression is pretty good.
Also compression sources for HPACK078 are available on
garbo.uwasa.fi pc/sources/hpack078.zip and HPACK compresses better
then ZIP2 on text files.

I find that when I click on the vertical scroller to move the screen down a page, it moves down by a little too much. You might want to fix that. I'd also love to see it if it could also display at least a few graphics formats (IMG would be enough to make me happy...). Lastly, if this is doable, I'd love to see it as a TSR within Neodesk, so that it could be called from memory and not have to be loaded everytime that I click on a .TXT file (yes, I'm aware that I could always have a .BAT file put it in a RAMdisk, but...). Either way, I'm lovin' it. (and will send in a check once I pay my taxes--the IRS comes before you do).

5184. Centris Corrections

Newsgroup: comp.sys.atari.st
Date: 1993-04-10 02:24:45 UTC
From: mrz5149@ritvax.isc.rit.edu
Message-ID: <1993Apr10.022445.5521@ultb.isc.rit.edu>
Source record: 207716

As someone pointed out the Centris 650's 040 does NOT contain
the full math coprocessor but instead contains the 68LC040.

I stand corrected. I was doing it from lab so I didn't have my
sources with me (should have waited). I checked MacWorld and
here are the OFFICAL stats on the LCIII/610/650 for comparison
to the Falcon. Just trash my other message. Sorry. I was pretty
close from what I remebered though...

LCIII:
68030 25MHz with 32 bit data bus
Cost with 4MB ram and 80MB hd - $US1349
(Note: Processor runs as fast as IIci's) FPU optional (socket on board)
VRAM 512k onboard (+ 256k slot) minimum 512k config supports 256 colors.
256k added offers 16 bit color. Memory capacity is 5-32MB.

Centris 610/650:
I'll post these in a new message....(got to go right now..)

Stay tuned!

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1q5cl4INN3l2@golem.wcc.govt.nz>
Source record: 207715

Even better than Photochrome, is Speed-Of-Light. Version 2.1 is the current version I think, GIF's only, and it is *fast*, does a real good job too!

5186. Mac Corrections

Newsgroup: comp.sys.atari.st
Date: 1993-04-10 03:05:39 UTC
From: mrz5149@ritvax.isc.rit.edu
Message-ID: <1993Apr10.030539.6125@ultb.isc.rit.edu>
Source record: 207717

Now, before I was so rudely interrupted I was attempting to put out
comparison statistics on the LC3/Centris 610/650. The following statistics
were taken from MacWorld who actually had their hands on these machines!
The following is posted for comparison purposes against the Falcon.
I posted stats on the LCIII in a previous message.

Centris 610
Processor: 68LC040 - 20MHz
4mb Soldered on board. Accepts 4,8,16,32MB simms. 68MB allowed.
Estimated Price: $US2959
(It's hard to give more stats on the 610 since it is only covered
briefly in the article whereas the 650 was given the most space. It seems
that the MacWorld people didn't like the 610 too much because of it's
small case which didn't allow standard sized NuBus cards.)

Centris 650
Processor: 680LC040 (Base model only) or 68040 (All others) - 25MHz
4mb or 8mb soldered on board. Accepts 4,8,16,32MB simms. 136mb allowed.
640x480 mode (as LCIII, 610 and other macs support) , 800x600 mode
support and 1024x768 mode support. 512k VRAM onboard - 8 bit color max.
1MB VRAM - 16 bit color max.
(It's almost as hard to give specs on the Centris since there are
so many configurations that make it hard to pin down any one feature.
With the LCIII there is little that can be changed to make the price
change too much or the performace but the Centris computers have so
many different configs it's hard to say which one is the one that
most people would be capable and willing to buy.)

Here's a copy of our campus book store's prices for different configs:
(All in US dollars)

LCIII w/80mb HD, 4mb RAM - $1139.00
LCIII w/160mb HD, 4mb RAM - $1269.00

Centris 610 w/80mb HD, 4mb RAM, No ethernet - $1509.00
Centris 610 w/80mb HD, 4mb RAM - $1599.00
Centris 610 w/230mb HD, 8mb RAM - $2049.00
Centris 610 w/230mb HD, 8mb RAM, CD-ROM - $2359.00

(Following has 68LC040)
Centris 650 w/80mb HD, 4mb RAM, No ethernet - $2199.00
(Following have full 68040)
Centris 650 w/80mb HD, 8mb RAM - $2599.00
Centris 650 w/230mb HD, 8mb RAM - $2899.00
Centris 650 w/230mb HD, 8mb RAM, CD-ROM - $3209.00
Centris 650 w/500mb HD, 8mb RAM - $3569.00

So there's the info. Hope it helps!

Next week of what year..... Wow....Who's going to get a Falcon if there are only two dealers?????????

By monday, you can get a Performa 400 system for $1349 with monitor, modem and claris Works at your local sears store. Oh I forgot, 4 megs and 80 meg hd and on site warranty....Can Atari match that? What ever happen to Power with out the price????

Later...

Sinclair2246@icscvax.uni.edu

Power to be your best: I love the theme.

Also

Amiga 1200 owner: I love it.....

> one and where?

The Hitachi 6301 is a member or the Motorola 6800 family. They seem to
be fairly readily available from semiconductor suppliers. There are
several versions available, including some EPROM versions.
There is also a "piggyback" version (68P01). This has no internal ROM,
but is fitted with an EPROM socket.

There is a program in the Data Becker Book "Atari ST internals"
for reading the keyboard ROM

> Is it compatible with PC keyboard?

No it's not compatible with the IBM-PC keyboard.

However, it IS compatible with DEC keyboards.

Does Masterbrowse work properly in Medium resolution!? If not, that would
be a good feature 8-)
(From memory, it looked rather strange)

5193. close to giving up

Newsgroup: comp.sys.atari.st
Date: 1993-04-10 13:19:03 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <10APR93.09190306@cc4.crl.aecl.ca>
Source record: 207725

For almost five years I have promoted and sold Atari systems. I am very close to giving up. I have just about lost all faith that Atari Corp can actually do something right.

Life was tough when I had to deal with Atari Canada. Now that I have to deal with Atari USA my problems have doubled and it just ain't any fun anymore. My frustration and anger level have pretty much topped out.

When I market products like Peak Performance hard drives (Mac drives hooked to Ataris via the DMA/LINK or SCSI) or modems, for that matter any product that is not ordered through Atari, I get the products in 24 - 48h (and I am in a REMOTE location). When I order product from California, it takes minimum three weeks, sometimes MONTHS, to get the products in. Hell, Pacific Software in California can get me stuff in 10 days, why can't Atari (which set up a special FAST distribution for products to Canada).

In the last 6-9 months, as everyone waits for the FALCON, I have lost money with my company (I sell only Atari systems and peripherals). I counted on the FALCON to get me back in the black but I cannot get Atari to respond to my requests for info on availability.

Question: Why should any dealer market products for a company that appears to have no respect for its dealers (who, after all are the ones that keep that company alive)?

> As someone pointed out the Centris 650's 040 does NOT contain
> the full math coprocessor but instead contains the 68LC040.

This is not strictly correct.

There is only one configuration of the Centris 650 that uses the 68LC040.
This is the 4/80 config which is the base model (i.e., the least expensive
C650 you can buy). _All_ other configurations use the 68040 (the one with
floating point hardware built in). There are far more configurations with
the 68040 than the 68LC040. Now, the Centris 610 uses only the 68LC040 -
there are no C610 configurations using a 68040.

> support and 1024x768 mode support. 512k VRAM onboard - 8 bit color max.
> 1MB VRAM - 16 bit color max.

This is a pretty incomplete listing of the Centris 650's supported display
resolutions. (The same goes for the C610, as it's the identical to the
C650.) Here is a more comprehensive list:

- NTSC timing, overscan and underscan, up to 16 bits/pixel (bpp)
- PAL timing, overscan and underscan, up to 16 bpp
- 512 x 384, 60 Hz noninterlaced (Apple 12" RGB display), up to 16 bpp
- 640 x 480, 67 Hz noninterlaced (Apple 13/14" RGB display), up to 16 bpp
- 640 x 480 VGA, 60 Hz noninterlaced, up to 16 bpp
- 800 x 600 SVGA, 56 Hz noninterlaced, up to 16 bpp
- 832 x 624, 75 Hz noninterlaced (Apple 16" RGB display), up to 16 bpp
- 640 x870, 75 Hz noninterlaced (Apple portrait display), up to 8 bpp
- 1024 x 768, 75 Hz noninterlaced (19" display), up to 8 bpp
- 1152 x 870, 75 Hz noninterlaced (Apple 21" RGB or monochrome display),
up to 8 bpp

Not exactly true, but close... They (Unicorn Publications) are now on a bi-monthly schedule. (Just got my "March/April" issue last week...) It no longer sports a color glossy cover, the articles are not preceded by any kind of editorial or even the smallest explanation, and the first article is decidedly anti-Atari.

They'll SURELY stay in business this way, huh? (Must be Atari's fault...)

Well, if you want to call it bi-monthly, for a single issue, that's OK.
My understanding is that they were pressured into putting out one last
issue to meet contractual obligations to advertisers (i.e., they didn't
want to give the money back). Unless something very strange has happen-
ed, they're finished with Atari. Bill and Patty have moved on from
Unicorn Publications to Pegasus Publications, producing an online mag.

The question remains about their obligations to current subscribers.

So go buy your Performa 400, who's stopping you, us? Please keep in mind
that some of us a) know what the Macs are all about, b) have used them a lot,
c) STILL don't want one, much in the same fashion that I don't want an Amiga,
either.

Has anyone ever used the programs rz.exe and sz.exe for VAX-VMS systems? I can get rz to accept zmodem transfers, but I can't figure out how to get sz to send files from the vax to my home computer. Whenever I try 'run sz' I just get a list of proper usage...but I can't pass the filename to send. If I try putting a filename after the 'run sz' command I just get an error saying "too many parameters". HELP! Does anyone know how to let sz.exe which file to send?

> Where did this come from? This doesn't
> jive with any of the prices you list.

That was the ERP of the Centris as dictated by MacWorld. As I stated earlier, the stuff I quoted was info I extracted from the pages of MacWorld. It was by no means complete or a review or something. It was just the information I pulled from the article. As for the video modes you mention later, they weren't mentioned in the article. I wasn't presenting the information in some kind of biased manner or something to slader Macs. That's not my intention (esp. since I like Macs, esp. the Centris).

I just put out most of the info from the article in a digestible form for small comparison's sake. Since most of the above info is pretty much all you'd need to know to make a rough comparison against the falcon.

The prices I quoted later were a direct extract from our campus bookstore. I would suspect the price variant because the article was prob. made about 2 months ahead of time when the Centris just came out and was given out to review.

If you really want to make a hardcore techinical review get the technical reference manuals for each computer and sit down with them :)

I made a few mistakes in some of my earlier articles but this one is pretty much on target. Oh well....

Have a nice day :-P

Hello John,

You have to define wahat's know as a foreign command.
Try this:
$ sz :==$disk:[directory]sz.exe

where disk is the physical disk and directory is the directory where the sz Image is located. also, define one for rz the same way:

$ rz :== $disk:[directory]rz.exe

If this programs are in your default login directory you can use:

sz:== syslogin:sz.exe
rz:== syslogin:rz.exe

The important part is the $ after the two ='s this tells VMS this is a foreign image.

Then "rz -h" and "sz -h" should work I give you a list of the valid parameters of both programs.

Source record: 207746

There was a thread a few days ago in c.s.a.s.t, where a number of people expressed interesting opinions regarding the possible porting of Linux to the Atari 68030 line of computers. As a user and hobbyist, I'm all for it, for the following reasons:

1. It looks to me as though the "Power without the price" trophy now belongs to guys (and girls) with *relatively* cheap 386 or 486 boxes (they do need a fair amount of memory and disk space, but so would a 68030-based machine running a linux port), and who are happily puttering about in X-windowland.

I think it's in the interest of Atari and Amiga owners to join them.

2. While MiNT/Multitos have a lot to offer, and still have potential, they are Atari's property. Linux, on the other hand, is controlled by the community of its users, and it appears to be a very active community.

Just my $0.02 (Cdn)

Today I got the Atari ST Nieuws april, and they confirmed this casing.
There also was information on a tower for the F030, with enough room for all
the things you want in it (?). That sounded even better (and very probably
even more expensive) to me.

The best thing I read about was the Mighty Sonic 32, which has room for 32
times 4Meg simms (so you can use 128 Megs of ram), a VME bus, and a 68030
CPU/33Mhz, which makes your F030 as fast as a TT030.

Source record: 207594

Here's a hard drive puzzle:

The drive won't respond. I've tried switching the host adaptor, power supply, SCSI cable, and SCSI drive. Since that's basically all the pieces, I'm stumped.

I suspect that the computer's DMA port may be broken -- except that it can read and write to the clock on the Supra host adaptor. Is that a guarantee that the DMA/ASCI port is working properly?

>That was the ERP of the Centris as dictated by MacWorld. As I stated
>earlier, the stuff I quoted was info I extracted from the pages of
>MacWorld. It was by no means complete or a review or something. It

Having read the article I think the MacWorld price is the price of a complete retail system, including monitor and keyboard. Here at OSU, the 610 4/ standard keyboard and Apple 14" RGM 14" RGB monitor is about $2050 or so. I wouldn't think it'd be that much off retail, but it could be (street price is not all that much higher than OSU prices around here).

An important thing to remember for macs is the price does not include keyd, and that will add $90-150 onto the price of the CPU (a price the Falcon does not incur), but, you get separate keyboard!

And, let us all remember...we don't know the *real* retail/street price of the Falcon yet! And, neither the LC III, or either of the Centris's (Centri ? Centris...I think the plural of Centris is Centris) are going to really hurt the music sales of the Falcon. (I have no idea how big that market it though...)

(Sorry about the spelling mess up there, but I'm typing through a line noise storm...my blood pressure is raising fast! Time to buy a new modem I suspect.....for my health at least!)

On this Amiga-1200 subject in c.s.a.st, an Amiga mag (Amiga Format I think), one of the reviewers was comparing the A1200, and the Falcon, and was completely rubbishing the A1200! (This was an Amiga magazine).

I'll type out the key points in the article & post them here.

(He stated that with Atari's machines, and Commodores Marketing, a killing would be made (not in those words, but you get the idea).

Hands up who thinks Atari will be dead before 1995? If they don't get either the Falcon or Jaguar out in full international distribution a bit quick, they will go right down the plug hole!

Warp-9 works great with Pagestream 2.2, and makes it a LOT better to use,
increasing the speed of things no end!

Notator, I'm not sure of - but from memory it doesn't have any problems.

Neodesk 3 speed+++

Warp-9 is a great little program, speeds something up by up to 5 times,
and generally makes using the ST much nicer!

The more recent versions have all sorts of fancy screen-saver 'modules'
similar to After-Dark on the mac', for most people this is a waste of memory,
but you don't have to use it! Looks great though!

Strange title for someone who is a real anti-atari zealot, but here goes, all flames welcomed and joyfully ignored...

To be fair to the three stooges, who would have predicted the PC price wars and the subsequent plummeting of mac prices. I wouldn't have... Would you? It's basically reduced the Falcon as well as the Amiga to footnotes. Too bad...

The nimrods at Atari seem to be struggling to do something, what exactly that something is, who knows? Maybe David Lynch...

Will I buy a Falcon? Probably not. I'm waiting for the Mac III myself, but there's a reasonable chance I'll ultimately buy a Jaguar when and if it comes out. Will Atari be around for this? Yep, they can probably limp on for the rest of the Tramiels' natural lives. The 3DO is just too damned expensive. And since Atari seems to be run like People's Express airlines (Yeah I know, look what happened to them plbthththth) their operating costs are probably right up there with the Tramhammers' bartabs...

But hey, it looks like the Falcon is a fun machine to hack. Of course, it's mostly masturbation, but then again how many Atarians do you know who can get a date? They've got plenty of time for this... If you're going to leave Atari, do so, they truly are hopelessly inept. But sheesh, sit back and take it like a man if you want to stay. They'll squeeze something out of their manufacturing sphincter one of these days...

In the words of certain unsuccessful political candidate:
"Sometimes, you just got to relax and enjoy it..."

Scott

Atari-Sometimes you just got to relax and enjoy it

Well Wolfgang as you only have a uucp site, I can't mail you with these problems..

VTxxx does not work with System Fonts, no nice boxes...!!!!,
this is the Problem that Steven is having.

Still no full support of Medium Res, in using your connligh.fnt,
I get what looks like 80 * 12..??

A small glitch, when a windows is opened the numbers to the right of the drop down menu window set ups, the top most pixels are missing, but if you go into one of the drop down menu window options, the numbers are then correct, there are the ````0000 things...

Is it not posible to contruct ConNect to be similar to Flash 1.6 as far as windows are concerned, ie, full screen for the sending and a normal Gem type window for the Text Editor and Capture Buffer, this also has the drop down menu bar, the send screen only has a bottom stutus line, you use the right mouse button to togle between them these two screens..??

It does give you 80 * 24 and a 132 mode for mono...

Roger..... sheppard_r@kosmos.wcc.govt.nz

Right.

The base model of the C610 has a U.S. SRP of about $1850. I've seen street prices in the S.F. Bay area of $1500-1600 range for this model. Of course, adding more memory, a larger hard drive, and an internal CD-ROM drive makes things more expensive.

The least expensive C650 model (which uses the 68LC040) has a U.S. SRP of $2699; the next model up, which has a 68040 (i.e., hardware floating point support), 8 MB of RAM, and 80 MB hard drive and ethernet on the motherboard has a U.S. SRP of $3189. (I'm not sure what typical system street prices are.)

What extras will be included with theFalcon? MTos on ROM? Thanks for
being here Bob. GA!

<BOB-BRODIE> Hi Bman, we've gotten a number of enquirys from new
dealers. I expect to be able to expand our dealer network
dramatically, and quickly as well. Among the most exciting thing to
the new dealer prospects is the fact that they will actually make
MONEY selling Atari Computers, unlike the skinny margins that most
clone dealers presently have to live with. Re the Falcon040: Sorry,
no comment about any 040 products. The Jaguar, our 64 bit game
console machine is due out this summer. The Falcon will ship with
^^^^^^^^^^^^^^
MultiTOS, Atari Works, Speedo GDOS, and the other 8 applications that
we previously indicated.

<ST.LOU> Thanks Brian. Next we have Dave Shorr.

<[Dave] D.SHORR> Bob, what is the STatus of the dealer demo unit
program and Atari's service agreement with GE? GA.

<BOB-BRODIE> The dealer demo program is going to happen, naturally
dependent on the dealer accepting our new dealer terms and conditions.
as for the GE program, there are legal issues that are impeding that
event from going forward. Unfortunately, I don't know when it will,
or if it will happen. However, the Falcon030 in reality only has

****

Can we believe him ?

Also what does Don Thomas, the director of atari marketting do ?
Is he very active ?
What are his plans to get atari on its feet. Can he be called a leader of Men.
Or will he guide us like the pide-piper did the mice ?

Message-ID: <1993Apr11.193320.26329@arbi.Informatik.Uni-Oldenburg.DE>
Source record: 207573

I hav enow running a TT and multitos 1.0
and a 386 40 and Linux

I think multitos is a nice try but there is no futur to a system that even
cant format a disk in the backround.
And as fare as I know there is nobody who gives it a real chance.

So why dont go to linux and use the compatibility of X windows and POSIX ??

In the now running Version of LINUX it runs very well and there is no drop
down in any kind of programm.

The question is :

IS THERE ENOUGH PROGRAMMER POTENTIAL TO DO THIS ???

Regards Martin

> ^^^^^^^^^^^^^^^

Who the hell in their right f_ucking mind would buy a Falcon today. It doesn't make sense at all. The Falcon is not out yet and will not be sold in reasonable numbers. By the time Atari gets off its ass to get Falcons out in reasonable numbers, you will be able to buy the Power PC for about the same time with a much better OS and Software....You have to be open minded..Your loyalty to Atari is religious regardless of what Atari comes out.

Now saying that the Mac stinks is your opinion not fact. Any eight bit color mac blows any four bit color low res ST. Even the Amiga 1200 in which I own too blows any Atari St. We have had Multasking since 1985...

I feel sorry for Atari dealers who have nothing to sell..Maybe they can become Power PC dealers and beable to eat too.

Amiga 1200 owner and Mac user---I love it...

Well, I don't want a Falcon either...By the time the Falcon arrives on these
shores, you can get a Power PC for the same price which is two to four times
faster than a Mac Quadra...You get an awesome OS and beable to use the Mac
Software base while the new ones are being written...

Smart move...I would get sick of Atari's lies too. Even the publishers of the old St magazine called START were smart to bail out early. They found out they could make a living with a Mac maginzine called Mac Home Journal...They state that the Mac is like god......

There is an ongoing Amiga port of Linux. It would be easiest for you
to wait until it's done; then you can just use most of their 680x0
changes for the TT/Falcon version.

I would honestly like to know where you get your figures for the cost of a PowerPC! I mean Byte had a projected retail of somewhere between 1,000-2000, but come on! That's BYTE just throwing a number in the air. I haven't seen any other reliable souce of the real price of one.

The CPU is *really* cheap ($50-100) and that will take prices down some, but I don't expect to see one with crappy video/sound/memory either. At this point, I don't expect Apple to release a PowerPC machine before first quarter 94 at no less than $2000 retail. (And no one expects Apple to release one before then...and when has Apple be ahead of schedule?). IBM will probably release a PowerPC machine by the end of this year. No one knows exactly what OS it will run (yet). I sure hope you wern't expecting to run TalOS on it...before 95 that is.

A PowerPC machine is a machine of *next year* or is that part of the point you are trying to make...the Falcon won't be out here till next year?

If anyone is willing to help me get some Uniterm macro files up and running I would greatly appreciate it. I just can't seem to get log-on macros to work (eg. get('CONNECT',10) send(';') ....etc!) I'm just trying to get the macro to recognize the prompts from the system i'm dialing to...it won't!!! It never realizes that 'connect' has appeared :^(Any help would be appreciated. I have looked at the examples in the Uniterm 2.0e release, but they are quite confusing. Flash .do files were Soooooooo much easier!!!

Wednesday Night Real Time Conference

April 7, 1993

Host - Brian H. Harvey

Guest Speaker - Bill Rehbock

<[Host] BRIAN.H> On behalf of the Atari ST Roundtable, I welcome all of
you to this CeBiT Real Time Conference. Tonight I would like to welcome
WIlliam E. Rehbock. Bill is Atari's Technical Director of Software
Development.

Who is Bill Rehbock?

Bill bought his first ATARI computer at K-Mark, an 800XL, for $99.00.
He started selling computers from his basement and finally joined ATARI
in the summer of 1990 to replace Charles Cherry. At that time he was
responsible for DTP market and was Director of Application Software.
Bill went on to the supervising of the software development for the
Falcon computers, and development of MultiTOS a

With that out of the way, let us proceed.

Welcome Bill, do you have a few words to begin this evening RTC?

Good evening everyone. I will give you a quick overview of
the goings-on at CeBIT, in case you didn't catch my posting in cat. 11.

Here is a short overview of what I found to be the highlights of CeBIT.
It is certainly not all-encompassing, but I think it does convey the
level of excitement in Europe over the Falcon. I personally would like
to thank all of the developers that pulled together and produced the
fine Falcon software that was shown at the Atari stand.

MultiTOS, SpeedoGDOS, Atari Works
```

Normen Kowalweski from Atari Germany drew large crowds while demoing the latest software offerings from Atari. Many of the developers were displaying their software running with MultiTOS and SpeedoGDOS. People were very excited to hear that the products have been released to the factory and that Falcons would be soon showing up with MultiTOS and Speedo pre-installed. Blackmail - Digital Optical Analog

DOA is negotiating with several large European distributors (including Compo) for distribution in Europe. Their Falcon-based voice mail system is currently undergoing FCC Certification and is expected to be available publicly by the end of May.

DA's Vektor - Digital Arts Digital Arts is the programming team that produced Retouche and Didot. DA's Vektor is a key-frame animation package that can perform 3D manipulation to 2D vector graphics, type, and bitmapped pictures. It's presentation graphic abilities exceed those of Macromind Director and Micrografix Designer. It retails for less than $200.

Profiler - Application Systems Heidelberg Profiler is Application Systems Heidelberg's new programming tool for their Pure C and Pure Pascal environments. It is a quality application used for debugging and optimizing programs.

TruePaint - HiSoft Falcon-optimized True Color Paint Package that retails for $60.00. It has a huge variety of import and export formats as well as simple animation capabilities.

Diamond Back/Diamond Edge - Oregon Research Bob Luneski's sanity-saving hard disk utilities were shown with full Falcon SCSI and IDE support.

Photo Studio - Eurosoft Photo Studio is a low-cost retouching package from France that is optimized for performing special effects and retouching on previously scanned or PhotoCD images.

Compo announced that it would handle distribution of True Paint outside of France. Chagall - Trade It Chagall is a mid-level true-color painting package from Germany that has a very advanced feature set, including high-end filtering, masking, and tinting. They hope to have the details for North American distribution worked out quickly.

Superbase4 - HiSoft/Oxxi Superbase4 should be ready for official alpha release within two or three weeks. The new version has full SpeedoGDOS support and support for imbedding a wide variety of graphic data formats into your database. It retains compatibility with Superbase Professional and allows importing forms from Superbase Amiga. The report generator is one of the finest I've seen on any platform and has the ability to add graphics to the output such as placing boxes around totals.

Falcon/VME - Rhothron Rhothron showed a VME expansion connector that plugs into the processor direct slot. The cable to the VME connector comes out of the Falcon through the space at the cartridge port. They were showing it working with the TKR Crazy Dots 32-bit true color board.

ColorDISC PCD - Color Concepts Color Concepts demonstrated all aspects of PhotoCD, including a PhotoCD module for Calamus SL. Phillips, Kodak, and Toshiba were all very impressed and surprised that we had such a full implementation of PhotoCD on the Falcon. No other platform has complete support for interactive/Portfolio PhotoCD yet.

MPEG Decompression - Brainstorm Brainstorm demonstrated 12 frames per second on-the-fly MPEG video decompression using MPEG video clips from Star Wars, Michael Jackson videos, news clips, etc. This is the same company that wrote the JPEG routines for Atari. The JPEG routines (320x200 decompression in less than one second) will be available to developers at the end of April.

VROOM - Lhankor Lhankor showed an extremely fast Gran Prix racing game optimized for Falcon. The game was still running in 16-color mode with PSG sound, but they intend to release it in September with all new 256 and true color artwork and digital sound.

Overscan Titler/Genlock - Overscan/Compo One of the main features of the huge video wall was the Overscan Video Titler. The titler makes full use of SpeedoGDOS and works with all ST's, but is optimized for the Falcon's overscan, overlay bit and color capabilities. The final product will be shipping at the end of April and there will be a NTSC/YC version as well as PAL/YC version.

Papyrus - ROM Software Papyrus shipped the latest version of their high-performance word-processor that now includes advanced table creation and calculation abilities. Papyrus has full color support and is in the same league as Microsoft Word for Windows and WordPerfect for Windows or the Mac. They signed up a yet-to-be announced North American distributor while at the show. The product is scheduled to be available in North America in about 6 weeks.

InShape - Alexander Thomsen With my urging, and the support from Normen, InShape has spent the last seven months rewriting their key-frame video rendering package. It can be used to create photo-realistic animations using CAD 3D objects and multiple light sources and cameras. It allows the user to be the movie director, adjusting the positioning of everything in the scene and directing the movement of objects.

Xenomorph (Phoenix) - Lexicor Lexicor had their German distributor demonstrating Phoenix, Lexicor's scene rendering package. Phoenix is unique in the fact that it integrates with the original Cyber Control desk accessory that was written by Tom Hudson in 1987. Using Cyber Control and Phoenix, a user can write complex scripts to automate the movement of objects in between recording frames. This allows the user to easily create animations of things like roller coasters shot from the perspective of a rider in the first car.

Cubase Audio - Steinberg Steinberg showed Cubase Audio, their Direct-to-Disk recording system that requires only a Falcon. Cubase Audio was the hit of the Frankfurt Music Messe, where Yamaha allegedly were extremely upset because Cubase Audio for Falcon would not require

Yamaha's several thousand dollar CBX-D5 as it does on the Mac and PC. Cubase Audio allows the user to integrate CD-quality digital audio along with MIDI data in the familiar Cubase user interface.

Musicom - Compo Another big hit at the Video Wall was Musicom, a consumer-oriented direct to disk recording system. Musicom has many fun-to-use features, including Karaoke. Armin Hirschteter, the author of Musicom (as well as singer and musician) demonstrated the Falcon and Musicom to crowds of well over 200 people at times, completely blocking all four aisles at the corner of our stand.

Digitape - Trade It Digitape is another multi-track direct-to-disk recording system. It has a unique modular approach, much like putting stereo components together. Digitape allows the user to create multi-track master tapes that allow the user to record on to two tracks while playing back mixed-down previously recorded tracks similar to how one creates professional recordings with conventional tape equipment.

Humans, Llamazap, Road Riot 4WD, Raiden, Space Junk - Atari Corp. All of the Atari project games were very well received by show attendees. During the Video Wall demonstrations, members of the audience were allowed to play Llamazap on the video wall using a Falcon Controller that was fitted with a 25 foot long cable. There were also nightly gaming "contests" on the video wall after the show.

PAMS Net/F - PAM Software PAM Software is taking advantage of the improved parallel port and now supporting low-cost parallel port Ethernet adapters with their network.

Bionet Falcon - Biodata Biodata showed their network running on the LocalTalk hardware built-in to Falcon.

32 MHz Accelerator w/ram expansion - GE Soft GE Soft showed a very impressive hardware accelerator that plugs into the processor direct slot on Falcon. It enables the Falcon to run at speeds comparable to a TT. The card can accept up to 128 megabytes of TT ram using commonly available SIMMs. When populated with expansion ram, you must use an external keyboard however, as there is not enough room inside the Falcon's case for everything.

Falcon Speed - Compo Falcon Speed was displayed on the Atari stand as well as the Heim Verlag Software Distribution booth. The version they were showing operated many times faster than most PC's running windows, because of the fact that they take advantage of the Falcon's video architecture. During the course of the show, they announced that they got full color support running and would be shipping the color version within a few weeks. (The current version does run in Windows color modes, although it displays in dithered black and white, as on many PC laptops.)

The Video Wall Events There were regular showings at the video wall, hosted by Armin Hirschteter(sp?), author of Compo's Musicom. The demonstrations were produced by Armin, Compo and Team Computer Video

Productions of Germany. The show integrated the Falcon's Video Titling, as well as Digital recording and DSP abilities. Klaus Kramer from Team had a remote-controlled camera attached to the stand and was able to direct it at Armin or people in the crowd. Musicom was used to record Armin's guitar playing and then affect it using Flanging, delay and other effects. Next, This One's for You by Elton John was played back from the hard disk and the Karaoke effect was used to remove the vocal. Armin would then sing along with it instead and the audience loved it.

Toward the last half of the fair, as everyone's confidence was built up, small alterations to the script were added. Klaus Kramer from Team had created an little animated character that would comment on Armin's singing during using the titling software from Overscan, which really drove home the Multimedia aspects of Falcon as Armin interacted with the little creature on the video wall. Theo Breurs from Compo also served as a shill in the audience, asking people whether or not they thought it was really Armin singing. When he found someone that said "no," that person was offered the chance to sing instead, with the lyrics being scrolled on the screen using Falcon.

The script to the show was altered slightly after we saw Digital Equipment's Alpha PC demo two booths away, comparing the speed of the 150MHz Alpha against a Mac Quadra and a 66 MHz '486 PC. DEC established that a reliable benchmark of the overall performance of a computer was how fast it could calculate and display a 256 color Mandelbrot set. The Mandelbrot set is the most popular example of a class of mathematics called Fractals. When the data is plotted, beautiful pictures are generated on the computer's screen. DEC showed that the Quadra took 12 seconds to create the display, the '486 took 8 and the Alpha took only 5 seconds. On our video wall, 60 feet away from DEC's demonstration, we showed the same thing being done by a low cost home computer in 4 seconds - in 16-bit true color, to the irritation of Digital Equipment. We can now start the q&a...

<[Host] BRIAN.H> Thanks Bill. I have the first question

Well, the question everyone wants to ask. How is the Falcon coming along? When will it be shipping? Are there any problems?

I can't say I am surprised at that question, Brian. The fact of the matter is that there really are no current problems with Falcon production...

<[Host] BRIAN.H> Any word on the release date?

the first units are honestly (to the latest knowledge that I got from manufacturing literally minutes ago) are supposed to be on their way. We did make the mistake of jumping the gun on release dates in the time-honored tradition of the computer industry and are suffering because of it now. Right now, I can only hope that we'll see these units within the next week or so.

The other problem that we have had (as far as motivation in justifying getting the burners _really, really_ cranked up has been that many (not all) of our dealers have been slow in turning in their new dealer agreements... Bob Brodie has been very frustrated as he's been calling dealers and they've been saying "You mean I really have to send that in?"

<[Host] BRIAN.H> Thanks Bill, up next is Mike Schuetz. Go Mike.

Hi Bill, Gruesse aus Wiesbaden,Germany! I have two questions:

1. What are the dates for this years Atari Messe in Duesseldorf? (Word here in Germany is, that there WON'T be one, at least not hosted by Atari.)

2. Is it furthermore true that all European offices will be sized down to pure sales offices with minimum staff, and that there will only be ONE warehouse for all of Europe, in the Netherlands in the future, that will supply all offices?

Mike, 1) What mag are you working for now? I missed you at CeBIT...

As you know, Atari Journal had to go out of business in January... so these questions come purely from a users stand point. I don't have any more money tied up in the Atari market other than the machines here on my desk.

But ST Journal did get picked up and is on the stands again, no? Anyway... There _is_ a restructuring going on in Europe, definitely not the gloom & doom that you have outlined.

St Journal? Never heard of that magazine in Germany before. Our mag, Atari Journal ceased to exist with the 01/93 issue.

(I'm sorry, I meant ST Computer; that one did go and come back, right?)

It will make operations more streamlined and is designed to increase developer and user support. As far as the Messe goes, Atari Germany is working on the details right now; I do hope that dates will be announced very soon.

Ok, Thanks, bill.

<[Host] BRIAN.H> Interesting. Thanks Mike. Up to the microphone or terminal is Michael. Ask away Michael.

Bill, glad to have you here. When the Falcons do start arriving in the next few weeks (fingers crossed) can you give us an idea of what kind of quantity the USA will see? Im just wondering when the supply will be great enough for all of us who aren't on a waiting list. Secondly does the dealer agreement prevent mail order sales of Falcons?

The dealer agreement most definitely prevents mail order of
Falcons without prior authorization from Atari. Based on the numbers
that have crossed my desk, the numbers do look pretty satisfying, but I
still encourage you to go spend money at you dealer :-)

Thanks Bill, Rising star is our local dealer.

(The numbers for North America _are_ serious
quantities to make a real market here!)

<[Host] BRIAN.H> Thanks Michael. Your turn Dave. Go Dave.

<[David] FAIRWEATHER> Aside from Cubase Audio do you know of any
Sequencer software that will use the DSP to generate midi-driven sampled
sounds? Cubase Audio is out of my price range.

I think will be seeing several DSP synthesizers in the next
few months. Many of these should integrate into low-cost sequencing
packages. There are other MIDI/Digital audio solutions being worked on,
but I don't believe that the developers have made announcements yet and
I'd hate to pre-announce products for them. James Grunke and I are
absolutely thrilled with the developer response on the music side of
things.

<[David] FAIRWEATHER> That's good news. Will the 1st shipment of
Falcons come with Multitos installed? That's all.

make it, make sure you send in you warranty cards. Yes, the
first Falcons will have MultiTOS 1.01 and SpeedoGDOS installed. We are
trying hard to have Atari Works inserted here. If it doesn't make it,
make sure you send in you warranty cards.

<[Host] BRIAN.H> Thanks Dave. Your turn Steve.

<[Steve@CNotes] S.KIEPE> Atari's credibility seems to be at an all time
low. I am surprised that you couldn't FEDEX a big box of Falcon's to a
dealership just to rekindle hope. Also, with the limited number of
dealerships, how do you expect to crack the market? There isn't a
dealership within 100 miles of my current home (Newport, RI) or my old
one (San Diego). How will you get these home machines into homes?

I think that the only thing that will truly rekindle hope
is Atari's long-term commitment to the dealer base and developer base.
We have been getting a steady stream of new dealer requests and things
do look very good. We are realists about the job that is ahead of us and
realize that Fed Ex boxes aren't going to do the trick for the long
haul. Our plans are a little more structured than that.

<[Host] BRIAN.H> Ok, Andrew is up next. Go Andrew.

<[Andrew] A.STUDER1> Why 16bit RAM? Compatibility? Cost? Is video slowed
because of this? Are 16bit HiColor [:) animations feasible?

Will Atari offer a Falcon upgrade policy? How about service, support,
and marketing. If increased, sales could expand.

16-bit ram... Cost and time to market; system slowdown...
our video is _really_ fast, the games and animation stuff we've been showing proves that (as well as FalconSpeed from Compo :-) The ram is really 32-bits to the video and memory controller, BTW.

It has not been Atari's policy to offer an upgrade path. There really isn't room in the margin for it. I do see increased service, support, and marketing in the future. We do realize that those are critical elements.

<[Andrew] A.STUDER1> Re CeBit, were Falcon sales active? Do you have numbers of Falcon's sold? The software/hardware lineup is promising.

Video is FAST, thanks.

1) CeBIT is not a "sales" show for anyone. (I wouldn't give you sales figures if it were :-) It is primarily a showcase show. The magazine interview traffic was excellent, and the dealer inquires were more than we expected.

<[Host] BRIAN.H> Thanks Andrew. John Brenner is next.

<[John B.] J.BRENNER1> 1 I'd like to know if you saw any video packages that resemble Adobe's Premiere software or Newtek's toaster.

2, You mentioned 32 mhz accelerator with RAM upgrade for Falcon, we have heard memory expansion doesn't work on this card.

3 ... <.and do you type with one finger ? ;-0

DA's Vektor does a jillion things beyond the original specification, many of which are very Adobe "Premierish". There are several other video packages in the works, one or two that will cause NewTek a little bit of grief :-)

Two fingers :-)

<[John B.] J.BRENNER1> Great news thanks!

<[Host] BRIAN.H> Thanks John, up next is another Canadian, Connor from the Can RT. Go Connor.

<[Connor] CAN-ASST> Hi Bill. Has the Canadian pricing for the Falcon been set yet? And what about the Canadian dealer agreement?

The on-the-fly MPEG decompression will definitely open the door to the desktop video arena.

Connor, I've got to be honest with you... I have no idea. It should have happened during CeBIT, but I haven't had a chance to check since I got back. Bob or I can give you a jingle via e-mail in the next day or two...

Whoops... I've just been told that Canadian dealer pricing _was_ definitely set. Check in the dealer category here on GEnie in the next few days. (You leave for 13 days... :-)

<[Connor] CAN-ASST> Thanks Bill.

<[Host] BRIAN.H> Great news for us Canadians Bill. In the past we were
us to getting the equipment before the USA. Up next is John K. Go John

<[John] JKUEHN> Bill, John Kuehn of Rockville Maryland here. My question
regards using SCSI II CD-ROM drives on the ST. I realize that CD-ROMs
were never officially released in the states. But, will it ever be
possible to use them on the ST. That is, is ATARI still supporting the
software development efforts required to provide a working version of
Metados. I assume that a complete .XFS driver for MiNT/Multitos has
been done, but, what about the TOS users? I have been working with two
software developers on this since Nov 92. And the current status from
both of them is Quote "Waiting on a resolution from ATARI". I mentioned
this to Bob Brodie here on GeNIE last month and he replied that he would
have to talk to you for the answer. So here I am at the proverbial
Equine Oral Orifice. (Waiting for a FALCON.)

John, the MiNT XFS drivers _do_ work very well with just
MiNT. That is the most recommended way of doing it.

John, does that answer your question?

<[John] JKUEHN> The .XFS driver that I have only supports Kodak CD_roms
I need one that will read other High Sierra AND ISO 9660 CDs

John, there is a newer version that we'll get posted in the
next week or so. We'll be doing a 100% q/a inspection on the first few
hundred F030's that come in and it will be keeping us busy :-)

<[Host] BRIAN.H> GO BRUCE

Hi Bill, What are my chances of talking you into attending
the Kansas City Show,June 26th and 27th? I realize you folks have to be
busy out there, but as this is a first time show, and the falcon a new
computer, they sort of go together. Just think you could ride down in
the semi of falcons;-)

Bruce, I'd personally love to come, but I can't commit right
now. I'd be happy to discuss it off-line.

in e-mail or voice? if voice give me a number and time to
call you please

Voice... 408-745-2082 in the afternoon after 2:00 CA time.
Bruce, by the way... Our factory rep base is being expanded rapidly and
we can try to have a rep attend at the very least.

<[Host] BRIAN.H> Thanks Bruce, up again is John B. Go John.

<[John B.] J.BRENNER1> Sorry to ask this again but I think it is
important. Is it true that the memory upgrade does _not_ work on the GE
soft card

John, I'm sorry that that slipped through. When I saw it, it
was working great. There were working out some BLiTTER problems, but

none insurmountable. Who started the rumor that it didn't work anyway?
:-(I don't think GESoft would appreciate it.

<[John B.] J.BRENNER1> I have read the memory board doesn't work, only
the clock speed up

The GESoft board is not just a clock speed-up, it has a
68030 on it. The CPU and Memory both work. Definitely.

<[John B.] J.BRENNER1> Thanks for the Truth.....seing is believing. :-)

(There was another board that cranked the F030's CPU up to
32+ MHz.) A little on the scarcy and not Atari recommended side :-)

<[Host] BRIAN.H> Thanks Bill and John. Up next is Bill Jones

<[Bill Jones] B.BILLJONES2> How important is New England to Atari? As
far as I know, not a dealer to be found. There was a dealer here in
Portland ME a few years back, so there are some Atari familiar folk
here. How to tap that well? I guess I'll visit Canada!

We have hired a very qualified rep firm in New England that
is just getting up to speed. We expect to see action in the next few
months. Ask your dealers to carry Atari and we'll make sure that the rep
beats them up :-)

<[Bill Jones] B.BILLJONES2> Good news! Thanks!

PLEASE do send us dealer names! We'll forward them to the
rep firms and get this boat moving!!!

<[Steve@CNotes] S.KIEPE> Will we see a real advertising push for Atari
or will it be another small scale job? I ask because the Lynx,
unquestionably the best handheld video game on the market, gets little
name recognition = low sales (comparatively), even though it got great
marks from consumer reports (zillions) and is ridiculously low priced.
The other 2 competing units are everywhere with much name recognition,
but the 2 Lynx's my kids have got get stares of 'what's that." Will
Falcon be left to the same fate? Please be specific on plans. really

re: Lynx, there is a wide-scale promo that will be showing
up in the next few weeks in all of the game mags. We do want to do the
same or bigger with Falcon. The more dealer area we have in the wings,
the larger the scale it will be. Sorry Steve, the dealers will get the
details first.

<[Steve@CNotes] S.KIEPE> It seems like a vicious circle - require
dealers for Atari to mount a large ad campaign, but there won't be
dealers without a market.

Ah, but you are wrong... we are signing up dealers right
now.

<[Host] BRIAN.H> Thanks Steve, up next is Jonesy

<[Jonesy] M.JONES52> Welcome, Bill, and thanks. I'm curious about the DEC/Alpha thing, more specifically, as to whether anyone from DEC strolled over to the Atari stand to talk.

Ho, you bet they came over. The fractal thing is a loaded benchmark anyway you cut it. We just called their bluff.

<[Jonesy] M.JONES52> That's all for now, thanks.

<[Host] BRIAN.H> Up next is Die Hard ATARI!!!!!

<[Die/!\Hard] D.VICHA> Last Friday, somebody mentioned Autodesk Animator in conjunction with the Falcon at CeBit. Are they signed? And are there any disgruntled NeXT devs in Germany looking to change gears for the Falcon?

We have been signing up a good number of NeXT devs, but they are taking a while to get their feet wet. The NeXTstep (software-only) devs will be ok with the '486, but those that liked the hardware are taking a good look at Atari.

AutoDesk U.S. is not officially doing anything active currently. There still is some CyberPaint Falcon activity (so I've been told.)

<[Host] BRIAN.H> Thanks Die Hard ATARI Up next is John. Go John.

<[John] JKUEHN> Bill, What is new on the Kodak Photo CD front? And who are the current players/developers doing PCD?

PCD Developer material is ready to go.

<[John] JKUEHN> The PCD Toolkit is done?

The cost of the development kit is $700 (same as the Kodak kits) and we are taking orders as of today. The kit comes with Pure C, GCC, bindings and Lattice bindings are being reved and will be ready in about a week.

<[John] JKUEHN> ST or Falcon or both?

It will work for all TOS Systems. BTW, I do want to mention on the animation front that Meridian from Lexicor is looking really good and should give users a lot of flexibility

<[Host] BRIAN.H> Great Bill. Thanks for the questions John K. The last question for the night was from Jim Ness but...

but he left to post it in the BBS:

Rumour is that Atari will not ship US Falcons unless more dealers are signed up! Any truth in this rumour??

Errrrng! Wrong, Jim Ness! Thank you for playing our game. :-) Is that clear enough?

<[Host] BRIAN.H> For me it is. Thanks for clearing up the rumour. Thanks Jim for asking it. We're drawing to a close for the formal

portion of the CeBit RTC. Before I put the room into Frenzy Mode, do you have any closing words, Bill?

Once again, I do wish to especially thank the developers that have been working with us on Falcon030 software. There is a boatload of great stuff in the wings from _many_ U.S. developers that will knock everyone's sock off. Yamaha U.S. has been working with us closely on promoting the Falcon and CBX-D5 direct to disk recording system with pro-audio A/D's-D/A's, and I can hardly wait for some of the apps from our old stand-bys! Thanks again!

<[Host] BRIAN.H> Great news Bill. I wish to thank you Bill for attending tonight RTC. I also wish to thank all the attendees for their questions and patience. In frenzy mode ...now!

End of Formal RTC

****

<[James] B.ABELL> James Grunke - Any news on Notator Audio for the Falcon?

Re: You'd have to ask them directly for an official announcement on Logic Audio. EMAGIC has a machine and they are pretty excited about the hardware.

Bill, what is the price for dev docs on falcon

G.Z. please contact 408-745-2022 for dev kit details.

We will run as lean and mean as we have to to make Falcon work world-wide! Jack and Sam really do believe in the product, but they do realize that the market is rough and that margins are really, really tough nowadays. That's going to mean even more belt tightening if necessary, but we _will_ be here.

<[Rob] R.ANISKO> Atari has the "luxury" of some pretty loyal users which helps out in times like these...

Jack made a strong commitment to me during CeBIT regarding Falcon Software development, and he definitely doesn't intend to roll over.

REAL TIME CONFERENCE SCHEDULE - All RTC's begin at 10:00 p.m.

April 12 - Pradip Fatehpuria - author of Atari Works
April 14 - Dateline Atari! with Bob Brodie and James Grunke
Win a free subscription to Atari Explorer.
April 19 - Nathan Potechin - Outline Art 3.0
Win a FREE COPY of OL3 or equal value fonts!
April 21 - Purple Mountain Computers (PMC) RTC- Oscar, Darek, Don
April 28 - ABC Solution RTC
May 5 - Missionware RTC with John R. Trautschold
DOOR PRIZE FLASH II 2.1

5246. Best Game?

Newsgroup: comp.sys.atari.st

I am interested in finding out what the best and most popular new
game is on the market. I am supose to buy one to raffle off at a show and
I don't play many games.

thanks for any help

Slip

5247. Re: Falcons shipping next week in USA!

Apple head of schedule...Have you seen the sh-t load of Product introductions in the past six months. Nice thing about Apple...An example- October 10, Apple announces a revamping of the Mac Line. That Same day, I walk down to the dealer and bought one of their new model. Now Atari....Some time in 1992, the Falcon is introduced...It is now 1993...Where is the F-cking Falcon???????

> --
> Ted Brown tbrown@cis.ohio-state.edu
> tbrown@magnus.acs.ohio-state.edu

My information comes from MacWeek the industry trade dealing with the Mac... Apple is head of schedule, and will have their first PowerPC on the market in January, 1994, the tenth anniversary of the Mac. Some form of the Taligent OS will be ready also and will be upgraded through OS modules... This baby will be cheap. Prices are expected in the Mac LC range.....

It doesnt really make sense to get a Falcon, which does not have a market and future. Thats the sad truth...

5248. MACophiles and Amigoids, please go away

Newsgroup: comp.sys.atari.st

Could all of you enthusiastic Mac and Amiga owners confine your gloating to the comp.sys.*.advocacy groups? Just when did comp.sys.atari.st become the favorite dumping ground for babbling techno-twits? Yeah, the Falcon is late; so what? If I want Mac (or Amiga) info, I'll read those newsgroups; I know how to find them, and so does most everyone else.

There will soon be a comp.sys.atari.advocacy; until then, I would prefer reading about things ST and Atari, and not some {BLEEP}{BLEEP} price list in comp.sys.ATARI.ST. Is any of this getting through? Sinclair? Raist? The fellow from *.rit.edu? I DON'T CARE! I DON'T WANT YOUR OBVIOUSLY BIASED OPINION, AND IT DOESN'T BELONG IN COMP.SYS.ATARI.ST!

Ahem. Sorry for shouting, but wading through a lot of inappropriate articles tends to be tedious, and eventually quite annoying. Anyway, cease and desist, restrain yourself, keep it fun, and maybe you should read Emily Postnews...

5249. Have they arrived yet?

Newsgroup: comp.sys.atari.st

From: azog@world.std.com
Message-ID: <C5Cq8y.7t7@world.std.com>
Source record: 207583

Ok. So Ive been hearing about the Falcon for, gee, it must be over a year now. Several months ago, I called up the dealer I like to patronize, and asked him what the deal is, and was told 'perhaps in March...'

So here it is April, and I havent yet gotten one. Whats the deal? Is this another vaporware product, much like the STbook? I know Atari is a smallish company, and doesnt have the resources like Apple does, to push out a new machine a year, but this is getting simply out of hand.

Ive not been reading this newsgroup for some time, but going thru the old postings, I really dont see much Falcon news. Ive long since packed up my STe in hopes of putting a Falcon in its place. The machine I am using the meanwhile is my VAXstation, so at least I am not high-and-dry...

So, should I give up on Atari? Dont wanna, cause I like the machines, but if the company aint gonna help out, why should I support them?

I am adversely against PC clones, so I can be sure I wont go that way. On the other hand, Sears has some Macs in stock right now. And altho the price is not cheap, at least I can get one the day I go there. Or I could go to an Amiga, but dont wanna do that, cause theres this mentality problem there.

Finally. If Ive waited this long, I can forget the Falcon, and wait a bit longer for the Alpha/PCs in about 6 months. These are under $3000 workstations, based on the 64 bit Alpha chip, but lobotomized down to like 66MHz or so (the real ones run at 150-200MHz). These are also machines based on the EISA(?) buss... DEC does seem to deliver on time, at least most of the time...

Just some thoughts. No flames, if you cant deal with what I am saying, then dont annoy me.

5250. THANKS.

To all of those who have answered my many questions, I would just like to say thanks. I tried responding via Internet, but found that it did'nt work..I'm new to this whole Inter/USEnet thing and don't really know how to use it very well yet..maybe once I figure out what the hell I'm doing, I can send you some private responses.

Well how about LEGENDS OF VALOUR or CIVILIZATION,

I have seen reviews of LEGENDS OF VALOUR and they claim it would be the Best
(Ultimate) role-playing game ever...!!!

Roger.............. sheppard_r@kosmos.wcc.govt.nz

5252. Re: GIF VIEWER FOR THE ST.

wells_s@kosmos.wcc.govt.nz (Steve Wells) writes:

>Even better than Photochrome, is Speed-Of-Light. Version 2.1 is the current
>version I think, GIF's only, and it is *fast*, does a real good job too!

Yeah! That's my program!! Wow...rivaling PhotoChrome...neat!

Wait 'til version 3.0...ooooooooooo! Blow you away, GUARANTEED!!!!

Oh, BTW guys, did you REGISTER YET??????? I want to see those Shareware fees!

If I see as few as I've gotten, I won't feel like releasing my lightning
fast fractal generator (TT Med, too). I'm trying to finish Speed of Light
Version 3.0 first. If you don't register, you can't use dithering, and
the histogram editing features, plus a lot more features. I will let you
do a few new things for a free trial, however.

Ask anyone who sent out their registration fees already and they'll tell
you that they got an IMMEDIATE response from me (Keycode, etc.).

Don't be scared by that Freeze Dried guy!!!! I'M FOR REAL!!!!!
YOU'LL GET NO CRAP FROM ME!! GUARANTEED!! (Not in writing, you'll have to
trust me.)

Believe me, it's to everyone's benefit to register for the program before
version 3.0 is released. Don't delay, I'm not going to cheat you!!!

Thanks for supporting Atari. They have a heart at least. bump..bump..bump...

And thanks for all who have supported Speed of Light so far!!

Stuart Denman

>It doesnt really make sense to get a Falcon, which does not have a market and
>future. Thats the sad truth...

Well, there is a market for Falcon...people like me who have a lot of Atari software already. Of course that assumes that the software will ruin on the Falcon <grin>, but if I go with a Mac, I can chuck my printers and all my software and buy Mac equivalents. That adds $5-700 to the purchase price of the Mac. With a DOS machine I can at least use my printers, but I still need to invest in $300 of new software.

There's nothing I really *dislike* about my STs other than the fact that the latest software that other systems have isn't being ported.

I don't even have a hard disk yet, so a Falcon with the 4/65 configuration gets me three big wins: a hard drive, four time the memory and the newest TOS at a price not much higher than adding these pieces separately to my 1040. Then of course I *also* get a processor thats a heckuva lot faster.

The negative side to my argument: if Atari is going to go belly up, I'll have to repurchase the software anyway, so maybe I should change platforms now. Well, that's the big decision, I guess, but if I buy Mac or DOS it won't be because I think they are really great machines. All I want is something to run my software on.

I have used HRAMDISK for 2 years now with no compatibility problems
or other nasties. It also installs without fuss as an auto program.
BTW if you can't get it to save it's settings to auto install, then
you must make sure the prog in named HRAMDISK.PRG and not HRAMDSK2.PRG
as mine was.

Message-ID: <H.ea.55lqAJCFe1_@semprini.tdkcs.waterloo.on.ca>
Source record: 207595

In <1993Apr5.104358.6091@ericsson.se>, Grant McFarlane writes:
> "Atari are bidding to rejuvenate the ageing STFM by dropping its price to a
> staggeringly low 159 pounds - and it is strongly suspected that the firm will
> also be dropping the prices of its STEs later in the year.
> The manufacturer stressed that the new move is not a price drop but a
> "re-introduction of the machine at an ultra competitive price point."
> Atari believe that at its new price the STFM can recapture some of its old
> glory days and hit sales of 150,000 units in 1993. Atari's Marketing Manager,
> Darryl Still, told us that they had considered dropping the eight year-old
> machine altogether but decided on a revamp due to perceived demand from retail.

"Since we can't bring any new hardware to market, and our attempt to get
software vendors to produce STe software has failed miserably, we
figured we'd produce yet another batch of the Same Old Stuff(tm). That's
our new motto, The Same Old Stuff. We've kicked Real Soon Now!"

The Atari spokesman went on to say that anyone waiting for a Falcon040
announcement should really go buy another computer. "We don't want
people waiting forever for something that will never make it to market."
When asked about people in North America waiting for Falcon030s, the
spokesman replied with a quick, "No comment."

I've missed the thread here, what is the British STFM price these days?

I used to own one over four years ago, and then it cost me 399 pounds, including a large software pack.

Do they really expect it to take on even the A600?

Mackem Ian.

There's certainly no problem with Creator (with Warp 9 set up to disable the screen saver while it's running), and Notator should be no different.

I'm a very happy Warp 9 user who finds it an extremely stable, totally
transparent utility that makes day-to-day computing tasks much more pleasant.
The extend-o-save modules and font manipulation goodies are neat, but just
gimmicks IMHO. It's worth the price just for the speedup alone. Buy it.

^^^^^^
I hope you were referring to the other folks there. If you think I own
a Mac you're wrong. If you think I hate ATARI computers you are wrong.
If you think I like reading loads of off topic posts, you are wrong.

I saw a thread that was going to explode. You know, somebody compares
X computer to ST. Then 1000 different people say that X computer's
stats were wrong, etc. So to finish it off, I just posted some SHORT
and offical statistics. I also posted it so that there was some information
to objectively compare the falcon to. After all, the falcon is competing
with Mac and a post or two of statistics doesn't hurt, it's the 500
follow-up messages.

I REALLY like ATARI hardware but I think that I'm starting to take on
the Bob Retelle (sp?) opinion of "love the computer, hate the company".
To tell you the truth, I like both Macs and ATARI's but I think they
are both suited for opposite jobs. I don't think I could live on just
a Mac unless I was forced to. (That's why I own Spectre GCR)

Times are a changin'. Let's hope ATARI can stick in there!

Close, but no cigar. The 610 uses the 68LC040. Also technically there is
an FPU in it, it's just disabled. :}

> The Centris 650 has the COMPLETE 68040 in it.

Close again. The base 650 (4/80 I think) also has the 68LC040, a fact that
has annoyed many Mac buyers. All other 650's have the full 68040. On the
650's you can replace the 68LC040 with a real 040, but NOT on the 610.
(There's quite a difference in price BTW).

/
Sir, it has been quite
a while that I haven't been
here.

Second, and get this, the reasons I have posted here is when I read
obvious non-sense where the A1200 or other computer is concerned. Personally,
I think the Falcon is nice, although the company itself might kill it.

|> The fellow from *.rit.edu? I DON'T CARE! I DON'T WANT YOUR OBVIOUSLY BIASED
|> OPINION, AND IT DOESN'T BELONG IN COMP.SYS.ATARI.ST!

And the guys that post here have an objective opinion.... what a concept.

Not quite - the 68EC040 does not have an MMU, but I believe it does have an
FPU. The 68LC040 does not have an FPU.

5274. The FALCON quest

Newsgroup: comp.sys.atari.st
Date: 1993-04-12 18:05:46 UTC
From: oconnor@took.enet.dec.com
Message-ID: <1993Apr12.180301.7491@ryn.mro4.dec.com>
Source record: 207607

I've been watching these FACLON threads and I just have to put my 2 cents in.

I have been a long time Atari owner, user and advocate.

But I have to say that Atari is losing me and a lot of people like me. The only reason I keep Atari now is for the software I own. I've seen a FALCON at a users-group meeting and yeah it is a nice machine but I can't buy one.

There are few dealers in the US. The market presence, at a time when market presence is all important is nil.

I guess everyone feels defensive about there machine but I just can't feel good about a machine which I can't even find hardware for let alone software. People with MACs and clones can not only go down software stores but they can also go to retail stores like Sears or Lechmere or Circuit City.

anyway...

Joe

Use the Z-Buffer algorithm. It just works! The painter's algorithm will always have cases that suck. If you're on a workstation, you'll have RAM for the Z-Buffer.

For more death case of the painter's algorithm, consult the graphics bible. Foley and van Dam, Computer Graphics: Principles and Practice. They also describe the Z-Buffer algorithm.

Ted.

5277. Re: Re:HELP:Displaying 3D objects in world

Source record: 207481

You will never get the painter's algorithm to work for all cases unless you want to cut up your primitives (most people play in triangles) into smaller and smaller pieces. Also, as your scene gets more and more complex the preformance goes to hell. Trust me, if you want to do it right, you must use the Z-Buffer algorithm. It is very simple because it works at the pixel level but eats up a good amount of RAM for the Z-Buffer. All of the big players in 3D graphics use Z-Buffers (I'm talking workstations here [HP,SGI,DEC,E&S and Sun]).

Basically, a Z value for each pixel of the primitive to be drawn is calculated. This is done in the same manner as interpolating colors for a triangle to do smooth shading. The Z-value for each pixel is compared to the Z-value corresponding to that pixel in the Z-Buffer (you need a buffer as large as your screen and deep enough for a good dynamic range (24-bits is common but 8 or 16 will do in a pinch). If the new Z-value is less than the one in the Z-Buffer (the new pixel is closer to the viewer than the previous pixel at that location) the pixel is rendered and the Z-buffer location for that pixel is replaced with the new Z-value. If the new Z-value is greater than or equal to the value in the Z-buffer (the new point is behind existing point) the pixel is not rendered (Z compare fail) and the Z-buffer is not written with the new pixel value. If you draw all of the primitives for a scene without regard to order the correct image will be drawn. You get the same pixel performance regardless of how many primitives are to be drawn. Very simple math is used to compute Z.

Read the bible by Foley and van Dam, Computer Graphics: Principles and Practice for details.

Ted.

Well, I'll probably buy a Falcon if they ever become available, and the last
(and only) thing I ever bought from Atari was my 1040STf in 1987. Like the
1040 when it was released, the Falcon looks like a good computer for music.

Look out, I must have rabies :-)

>dealer and bought one of their new model. Now Atari....Some time in 1992, the
>Falcon is introduced...It is now 1993...Where is the F-cking Falcon???????

If you want to be technical, the Falcon has not been "announced" in the US,
it has been announced in Europe though (and it's for sale there too).
I've known about those new macs for
awhile now...I've been waiting for the DSP macs for over a year already.
Yes, Apple is better now, but timing the announcement so it coresponds with
the product availability date is just a simple marketing trick. If Atari
tried to do that, we'd all scream "Atari is doing nothing, they're doomed!"

Considering Apple's current supply problem, I'm actually amazed that I *can*
pick up a LC III and take it home. (Let me stress again in case you missed
it..hey I'm waiting for that PowerPC mac now for *over a year*! I've been
waiting for that DSP mac *for over a year*! Gosh I wish Apple would
realeas stuff on time!!)

>My information comes from MacWeek the industry trade dealing with the Mac...
>Apple is head of schedule, and will have their first PowerPC on the market in
>January, 1994, the tenth anniversary of the Mac. Some form of the Taligent OS
>will be ready also and will be upgraded through OS modules... This baby will
>be cheap. Prices are expected in the Mac LC range.....
>

note Please that "First Quarter '94" == "January '94". I read MacWeek too,
and you sure are putting a positive spin on the availability of TalOS. They
said those macs would be running a form of the normal MacOS with a 68020

translator taking care of running normal mac apps (this is *not* Taligent) but might be considered a piece of the final Taligent Macintosh emulation code. Apple is known for ballparking thre release price of the machine as being too low. This is a "ballpark" figure for a machine that hasn't entered beta yet!

It does depend upon the given day on how positive the news of Taligent is... but, again, I don't expect it in it's full glory till 1995. I do expect a PowerPC mac running Sys 7 (8) next year...but that is eight months away from now! And I just don't expect them to sell for $1299! Apple has already stated that the MacOS module for TalOS might not be available when it's released. What more do you want?

Keep in mind, I am *not* an Atari zealot..even though I own one, I'm much more of a Mac zealot (actually a NeXT zealot...) and trying to convey imminent release of the PowerPC w/Taligent for the cost of a Falcon is just a little to far from how I percieve reality.

And, rember one thing about the Falcon. I dont' think there is a machine within $1,000 of the price of the Falcon that has the same sound capabilities that it has. That little fact there will sell at least a few of the machines.

Source record: 207612

I for one will be buying a Falcon as soon as they are out. I'm
#1 on the waiting list at B&C. I do not appreciate the name calling
of some of the "other system" owners. I have been working with computers
for over 20 years. (both hardware and software) I've been a unix
power user for the last 7 year. My last 4 years have been spent
giving hotline support on Pyramid hardware, ucb unix, att unix,
SVR4 and networking. (I love unix) :,)

As you can see, I am not a brain dead computer user. I use both a Mega4
and a TT networked together at home. The Mega4 has a genlock, a FAST16,
scsi tape and a PC Ditto II (yes, it works great). I am very happy with
the fast and easy to use interface of the Atari. My wife and kids
have never had a problem using the system. I have used both PCs and
MACs at work. After using other home computer, I choose Atari.

I read this group to be informed about Atari computers. I have decided
what computer I want to own. I do not need owners of other systems
calling me names because of the system I decided buy. If you do not
have something positive to add to this group, press "u" now.

thanks,
Al Palmer

From: boyd@gauss
Message-ID: <C5EI7I.8nw@mailer.cc.fsu.edu>
Source record: 207618

I mentioned ordering some ST stuff through the mail, and have gotten several requests for some phone numbers. I post them here for all. If you are in the continental US, call up the 800 numbers and get the catalogs!

Sideline Software: They have the latest euro ST games, and a good bargin bin. Give them a call if the product is at all old, as euro games get very cheap very quickly (I bought a $45 game for $15 about 2 months after it was released). 1-800-999-9273

Video Palace: This guy claims to have the biggest library of ST software in the country. He has found everything I have asked for (including some very obscure stuff). (407) 465-4745

Toad: These guys have lots of ST hardware and software, but are not exactly the cheapest place to buy from. Be sure to get on their mailing list (their catalogs are excellent and free). They can answer just about any ST question. 1-800-448-TOAD.

L&Y Electronics: An excellent ST store in VA (up near Springfield). The family that owns it is very nice, and they have a big inventory. They also do mail order, and have a big $10 bargin bin. Visit it if you are in the area! (703) 494-3444

D&P Computer: Mostly ST hardware, they make good HD enclosures. I bought one of these instead of a Toad, due to better quality and price. They also print a catalog, so get on the mailing list. 1-800-535-4290

E. Arthur Brown: They print a newspaper-like catalog, lots of good buys. 1-800-322-4405

5289. Desktop font - changeable?

Newsgroup: comp.sys.atari.st
Date: 1993-04-13 03:41:41 UTC
From: warwick@cs.uq.oz.au
Message-ID: <12918@uqcspe.cs.uq.oz.au>
Source record: 207619

Is there any way, even the ugliest machine specific kludge, to get to use
different AES fonts?

The reason I ask is that Julian R.'s excellent BigScreen program allows
someone with an ST to emulate a TTmedium screen for the purpose of
software development (not much use otherwise - it's too slow, just as
Julian indicates)... EXCEPT, the font is still the 8x8 system font,
whereas TTmedium uses the 8x16 system font.

By the end of the week, it won't matter to me - my TT will have arrived
by then (Ye-hah!), but I certainly found developing with BigScreen a
great help - and a font changer would have been an additional help.

Source record: 207623
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I have been trying to use alchemy junior as a sequencer on my
JV-30 (Roland) but have been having trouble. The sequencer will
happily play on the keyboard, the prerecorded songs work well as
does the click track. When I record as segment and drag it to a track
it always thinks there are zero events (although all the events actually
are there when observed in the patch diagram). I know I am supposed to
double click on the pattern to set a new pattern to paste the track into
but the double click never does anything. The result of this is playback never
produces any sound from the keyboard!

I know the atari is OK because 32track records and plays back properly,
it however doesn't handle patterns; my primary use is for a rhythm recorder?

The atari is and st with 4 megs, any help would be greatly appreciated!

>

Sigh. The Falcons that were benchmarked were the /slower/ developer
revision models. When some demo coders got their hands on production
Falcons, they are able to perform graphics manipulations in 65,536
colours that would probably be nearly impossible on even 50 Mhz 486s.
When Falcon-specific games are available in the coming months, it
will be demonstrated that the Falcon is the superior architecture
for many applications.

The tradeoff the designers made (resolutions <= 800x600) is more
than compensated by the flexibility of having up to 14 MB of graphics
memory with hardware scrolling support. The upgraded BliTTER rated
at /64 million/ pixels per second is unmatched by no other US$799
or even US$2000 computers that I know of.

Those are some of the reasons why I have to laugh when a Mac user
spouts off about the new Centris and Quadras. I predict that
when the new flight simulators for the Falcon are released and
compard with those available for the Quadra, the serious deficiencies
of the Macs will be graphically evident. Of course, when audio
capabilities are also accounted for, then the question will not
be whether Macs are getting cheaper, but if they are worth more
than a few hundred dollars.

I will also be watching the maturation of MultiTOS with great
interest. Its current capabilities--

- preemptive multitasking
- threading
- memory protection
- multiuser support(?, not sure of this)

The lack of memory protection in the Mac OS is reason enough to
avoid Macs, because one thing is certain--software memory requirements

are growing both in size and complexity. Atari should certainly publicize the defective and dangerous nature of Mac memory (mis)-management.

When Atari is given time to optimize MultiTOS to its fullest potential, it will be reason enough to buy a Falcon computer.

I think this is an April Fool joke. I first heard the story on Channel 4's
teletext magazine Digitizer which spouts drivel at the best of times.
When Grant said ST Doormat were carrying a similar story I thought it was
more credible but upon reflection I remember that Future Publishing are
in bed somewhat with Digitiser so it looks like a joint April Fool joke.

BTW> I wish they'd scrap Digitiser and bring back FX which was much better.
Digitiser seems to have gone down the same purile path as Gamesmaster.

According to the teletext service on ITV in the U.K. this is exactly what has happened!Apparently the Swedish subsiduary (sp) discovered a warehouse of old, but unused,STFM boards when they were doing a stock-take,i.e.they *lost* a warehouse full of STFMs!

Another thing to remember about these new STFMs is that,according to ST Format, it is near impossible to upgrade them to one meg memory.

Guess that'll not bring you any forward. I'm also registrated as a user, but
have never got any updates automatically. Instead it is a wise idea to ask
them every year or so for a new version, they'll send it you immediately!

5302. MultiTOS and DESKICON.RSC

Newsgroup: comp.sys.atari.st
Date: 1993-04-13 11:49:09 UTC
From: hn@piccomin.informatik.rwth-aachen.de
Message-ID: <hn.734701749@piccomin>
Source record: 207633

Using the MultiTOS-Release (AES-date 02/16/93) I got for my FALCON at the
CeBIT I encountered that colored icons will grab 0.6MB of RAM!

Using the Icons in DESKICON.RSC in modes which don't make use of
colored icons (i.e. <16 colors graphics mode) reduces the available RAM
(shown in Desktop Configuration - Menu) by 64KB as you'd expect, because
the DESKICON.RSC file is 64KB long.

But in graphic-modes with >=16 colors the DESKICON.RSC file will take
600KB of RAM compared to the available RAM without DESKICON.RSC.
(According to the Desktop Configuration - Menu.)

Is it a bug or is it just a problem of memory-fragmentation ?
(I think in both cases it should be fixed!)

bye,

5304. Falcon/030 Raytracers?

Newsgroup: comp.sys.atari.st
Date: 1993-04-13 12:53:20 UTC
From: G.Coulter@Daresbury.AC.UK
Message-ID: <1qed40$2a7@mserv1.dl.ac.uk>
Source record: 207637

Hi Everyone ::

I am trying to find some information on raytracing packages
for the Atari Falcon/030. I have heard that there are a few
in the pipe-line most notably (INSHAPE) & (Phoenix 512). If
anyone out there has seen; is using; or simply has any info
on any of the above, or any other raytracers for the Falcon/030
I would love any information.

Thanks for all your time & any information:

-Neill- (Using My friends Account .. Just reply to him he will
foward anything on to me.)

Thanks again ..

5305. FREE TOTALLY ORIGINAL GAME! "Flipped" now on Atari.Archive

Newsgroup: comp.sys.atari.st
Date: 1993-04-13 12:58:42 UTC
From: evilandi@vnet.IBM.COM
Message-ID: <19930413.053844.680@almaden.ibm.com>
Source record: 207636

My game "FLIPPED" is now on atari.archive. To get it, send an email note to <atari@atari.archive.umich.edu> with the body of the message (not subject) as:

send Games/flipped.zoo

In its UUEncoded state it is about 130k.

I am not able to post it to the binaries newsgroup myself, so perhaps if someone could volunteer to do it for me- please email me first- thanks!

"FLIPPED" is a TOTALLY ORIGINAL puzzle game for any colour Atari ST/STE. The object of the game is to "flip" tiles over on a 9x9 grid so that all tiles are the same colour. However, flipping one tile affects others around it. There are 100 levels, and to get you started, here are the passwords for the first ten levels:

00:BEGINNER 01:WELLDONE 02:NOWTRYME 03:INITIALS 04:THECHAIN
05:STRIPES 06:HARD NOW 07:3 ARROWS 08:DIGITNOW 09:GOODLUCK

Email me please with comments and requests for hints (help file available). Please download this game to your local PD library- I want this game to go worldwide ("15 minutes of fame... dream on!").

"FLIPPED" first appeared in 1992 on the coverdisk of Atari ST User mag, but is now public domain. A souped-up version is available from most UK PD libraries on the Budgie UK Licenceware label- ALL PROCEEDS TO CHARITY. This Budgie version includes 100 new levels, original tracker music and a level randomiser to create megazillions more levels. Ring Goodman Enterprises now on UK 0782 335650 with your credit/transaction card to get it fast (I gain nothing- "its all for charity, computastic pop pickers!").

Look out for SQUARE OFF, a new arcade/maze game soon on atari.archive.

Enjoy...

But, for typical users, an LC040 is fine... They don't do much raytracing,
CAD, or PhotoShop work.

And I have a feeling that 25Mhz LC040 is going to be a bit speedier than
the 16Mhz '030 in the Falcon. If it ever shows up.

The problem is that Cubase isn't screensaver compatible. Cubase catches
each mouse- and keyboard event.

It's a kind of bug resulting from the memory protection on 68030 cpu's.
The problem will be sovlved soon - just like the XControl that uses too
much memory in this configuration.

To get MUCH more RAM rename MINT.PRG to MINTNP.PRG. No you don't have
memory protection, but much more free RAM.

5310. 520ST single sided drive problem

Newsgroup: comp.sys.atari.st
Date: 1993-04-13 14:06:25 UTC
From: cashman@silver.ucs.indiana.edu
Message-ID: <C5FDur.73y@usenet.ucs.indiana.edu>
Source record: 207640

Greetings,

I have an old Atari 520ST purchased in spring of 1986. I have
a single sided external disk drive attached to it. It has worked
fine for many years, but now has a problem.

When a disk is put in, and an access it attempted, the "disk read"
light goes on, as expected, but the disk drive motor does not
go on. Relevant warning message appears on the screen, about
connecting power, checking connections, etc.

I've taken the drive apart, checked all connections, and still no
luck. I believe the problem may be the stepping motor.

Has anyone had a similar problem? Any advice??????????????
I *really* need this drive.

While I doubt that it would be worth the investment for a company to
do it. I can see some interesting prospects in your second comment...

> At the very least they could rewrite the development package for Atari.
>

Once GNU-ObjC is complete and a port to the ST is finished it is just
a matter of working up a new object hierarchy for the Atari. I personally
think this would be cool since I have two NeXTs, and now, two Atari STs.
I co-port to both the ST and Falcon architectures would be really cool.
I just don't know nearly enough about the architecture of the ST (ie.
restrictions like memory and disk I/O speed, etc...)

Marty, I wish someone could help you out by giving you a copy of the GFA compiler but unfortunately, such action would be illegal. Even though the GFA BASIC 2.0 interpreter has been placed in the public domain and the 3.5 interpreter has been published as an ST Format cover disk, the compilers for both version 2.0 and 3.0 remain copyrighted, commercial software which may _not_ be freely distributed.

Contact GFA Software Technologies in the US at 1-800-766-6GFA and they will be happy to sell you a replacement copy of the 2.0 compiler. Even better, go ahead and upgrade to 3.5 as it is so-o-o-o much better than 2.0. Either upgrade will not cost much, you'll be happy and you won't break any laws.

I have a Deskjet 500 hooked up to a standard 520ST with 1 DS drive.
I'm currently using 1STWORD, which is fine most of the time, but
occasionally, I'd like to use a larger font than the printer's built-in
fonts. I want a WYSIWYG with bit-mapped fonts that works with a Deskjet
and doesn't require lots of RAM or a hard disk.

Any suggestions?

>At the very least they could rewrite the development package for Atari.
>

Actually I think that NeXT has their hands full trying to port NeXTSTEP to platforms with more power than a Falcon (and better able to absorb the cost of a $700 user OS package). It's hard to sell an OS that costs about the same amount as the machine. NS/FIP Developers version costs *more* than a Falcon.

I'm not one to say that the Falcon couldn't run NeXTSTEP either...I own an 030 cube, and it runs 3.0 just fine. If they used the blitter chip intelligently, they could probably make it perform better than my cube. I haven't seen the real disk i/o specs for the SCSI II board on the Falcon, but I would think that it'd be better than the SCSI transfer rate of my cube. The only problem the Falcon would have is lack of memory space. You'd need the 14M Falcon to even think of booting NeXTSTEP (8 MB on a NeXT is extremely low).

NeXT has enough problems at the moment, and I think their resources are going to make a MIPS/PA-RISC/Sparc port first, rather than worry about porting to a machine with lower performance than a NeXTStation.

Why don't you take this over to atari.advocacy where it belongs. (and the
problem of a math coprocessor is partly mute because the Falcon doesn't
ship with one installed).

What do I call it? I call it a promo of a product that is going to be
released in the future...NOT an announcement of a product for sale.
Did they say anywhere in the BCS rollout "now available"? Apple does
the same thing with the Newtons only I don't think you have, up to now,
been able to touch/use a Newton, and they were supposed to be on sale already.
(Does that sound familiar?) Clarinet posts all the official product
releases. The Falcon has had one, but it was marked as released in Germany
or Belgium (I forget which), and it specifically said so! When Atari
releases the US model, I expect to see another press release stating so.
We'll see the difference in times between announcment/purchace then. I
really don't expect what Apple has done though...Apple has a better pipeline
to dealers (even if it's a bit clogged at times).

There is quite a bit of difference between demoing a beta product, and the
official announcment of it's release. Just becase that was *supposed* to be
the official release doesn't mean anything. As I said, Apple has just
learned their lesson (for the most part) and they keep all official statements
about hardware to a minimum, and just announce them when they are ready for
sale. But that doesn't mean we don't here about them...and wait for them!
(And Apple really reeks with the software announcements...they can't ship
anything on time there...Casper, Sys 7, Sys 7.1, Applescript, Worldscript,
etc, etc, etc)

5324. *** Need HELP with the game "SDI" ...***

Newsgroup: comp.sys.atari.st
Date: 1993-04-13 17:18:07 UTC
From: M14563@mwvm.mitre.org
Message-ID: <16BAFBB0F.M14563@mwvm.mitre.org>
Source record: 207456
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi There,

I am currently borrowing the game "SDI" from a friend, (using original diskettes -- no pirating). But, when I try to use it on my Atari 1040 ST, it *bombs* just as the *little man* runs through the first tunnel. Just as the image of the man leaves the screen on the left side, (after this, a disk read *should* occur, loading another part of the program into memory and allowing the player to continue with the game), two bombs appear. My Atari has 4 MB of RAM. I also tried this game on an Atari 1040 STe, (not sure of the RAM size), and it also bombed at the same point. My friend has an Atari 1040 ST with 1 MB of RAM and tells me that he has no problem running the game whatsoever.

Could someone let me know if I may be running into a problem involving my upgraded memory and this particular game? I would really like to know if there is something that I can do to get around these *bombs* so that I can play this game; (really, I am doing this for my sister -- SDI is one of her favorite games. I really know very *little* about this game. All I know is that my sister would play this game for *hours* at a friend's house. So, she would be most appreciative of any and all help 8-)).

Thank you in advance for all of your help. I truly appreciate all efforts to help, (as does my sister). Take care *each* and have a nice day!

(FYI - I am a new Atari user and am *not* an Atari programmer; I am however familiar with IBM PCs and with Macs to a degree.)

Again, THANKS! 8-)

-- Terry

I think you're wrong there, they will definitely hurt, as they have been
selling a lot of Macs for midi lately while Atari tries to make computers
and continues to "rightsize" itself. Including direct-to-disk recording
with Cubase Audio, although extra hardware is required.

Apparently Atari went thru a round of layoffs so that probably was one
reason for dip. The continual delay in shipping the Falcon030s also
contributed to the movement. It's currently hovering around $1/share.

>What's up? Does atari actually have any liquidity?

Probably enough to sufficiently market two of their three main products:
the Lynx and Jaguar. Manufacturing and marketing the Falcon will most
likely take less precedence. That tactic will payoff in the longterm
because, as people pointed have pointed out, the popularity of the Lynx
will increase tremendously once the Jaguar RISC64 console is released.
Atari will have two *leading-edge* consumer electronic products that
they can cross-promote to generate the name-recognition and revenue
which will legitimize their third system, the Falcon.

>I'm not a stockholder but at 75 cents a share, and the Jaguar rollout
>'supposed' to be at summer CES(June) looks like a stock that might move?
>or evaporate? but then again you may double your money.

If the Jaguar rollout sticks and supported with marketing, we will
be witnesses to an Atari renaissance. Until its release though, all
Atari can do is churn Jaguars off manufacturing lines like potato chips
and stock their warehouses. That takes a lot of cash Atari would have
used for marketing the Lynx and developing the Falcon. That's one
reason why I think they should license the Jaguar (and Lynx) to large
Asian manufacturers and concentrate on what they do best -- hardware
and software design. I would bet the Jaguar and Lynx could easily
become standards that dominate as much as the "PC." And the Falcon can
only benefit from the success of the Lynx and Jaguar.

>I really wanted to know why it took a hit. Surely not becuase of the
>San Francisco Chronicle article that detailed the dropping of the lynx line
>[actually that was an april fools joke on alt.games.lynx]

People should expect more malicious attacks on Atari because some
people perceive them as a threat for whatever reason. Substantiated
criticism is fine, but outright lies and spiteful rumors shouldn't
be tolerated.

>Still inquiring minds want to know.

All I can say is that people get more useful information from the
New York Times than the National Enquirer.

I upgraded mine to 1 meg. The space is there on the board. Just need to get out a soldering gun and plan on spending a little time. After that, you need to snip a few resistors. Works fine.

I believe on some boards, Atari has soldered OVER all the places you would put the chips, to make it harder to upgrade. I am not sure if this is so.

i have an Atari 520ST (1985), which i pulled out to use in a MIDI
environment.

everything worked fine... for awhile...

shortly after running the machine,
the drive started 'acting up'.

the window would say that 0 bytes in 0 items used.

next the red light would not come on, and the drive would
just spin, and not stop until i turned the machine off.

any help would be appreciated.

is this a simple fix?
is this drive repairable?
if not, how much is a replacement?

i've heard the ST is a good MIDI machine.

sincerely,
mschaf@math.uno.edu

5333. Warp 9 - Thanks

Does anyone out there have a program to format floppies for 15 or
16 sectors (it is for a 5-1/4 HD drive hooked up to an ST).
I think it is called :
HCOPY
Diamond format does 18 sector format but not 15 or 16.
So if anyone out there has or knows of where to get such a program, could you
please let me know?
Many thanks in advance!
(If you don't have it an FTP site will do) Thanks !

```
] > Compo has planned a 286 and a 486 emulator for the Falcon; no 386 emul
] > Yes, it means the Falcon can be DOS compatible (fun, fun, fun).
]
] Keep talking here, you could win me back from the Commodore camp! :)

The 486-emulator should be completed by now.
```

Normal VGA emulation (640*480*256), as well as the usual modes below
it. Emulation at a reported 32Mhz. Full access to all of the compatible
external ports on the Falcon (So you can use SCSI-2 hard-drives on the
'IBM'. As well as 1.44meg disks of course). There's even rumours of
their being slots on the emul���S2�
2�%N&)η�8
there being slots on the emulator to plug cards onto (such as soundblaster
etc.) This I find unlikely however, Compo' *Might* be able to use
Falcon sound as an emulator of the sound-blaster (not difficult, but
whether or not they can/will/have remains to be seen)

```
So, basically, plug this thing into the falcon, and you have an 80486
running at 32Mhz, with VGA graphics, and around 4meg of RAM available
(on the 4-meg Falcon), instead of 640K!
```

5342. 68030 in ST hack & cartridge

Newsgroup: comp.sys.atari.st
Date: 1993-04-13 22:03:33 UTC
From: fsctc@avelon.lerc.nasa.gov
Message-ID: <1993Apr13.220333.23416@eagle.lerc.nasa.gov>
Source record: 207498

Two questions:

1. Has anyone done a hack of placing a 68030 inside a ST for the fun of it? I know TOS 1.0-1.6 has problems with the '030. Will TOS 206 work on the '030? Since both Dave Small & Jim Allen have such boards and they both licensed TOS 2.06 from Atari, does that mean TOS 206 used in their board has been altered to work with the 030?

2. Cartridge boards for the ST is expensive and unusual. Do any of the cartridges for the older 8-bit Atari computers fit the port on the ST?

No there is none, get more memory for one thing, Graphic type fonts
use a lot of Ram, I use Script, and with a ome meg machine you can only have
one font resident and I also use a DeskJet....

Most of the better word processers would need more that one meg to be
usefull..

> EVERYTHING you do involving the CPU ... ???

Putting a 68030 on a 16 bit bus will only effect memory-move-intensive
(as opposed to calculation-intensive) applications. And even then,
not to a huge degree. The 030's big advantage comes from the Cache -
which is unaffected by a 16-bit data bus.

Which applications do you need speed from? Your word-processor? No,
you need it for your CAD program, and your DTP program - ie. the ones
that will gain from a math co-pro.

MOST applications requiring speed (you haven't fallen into the PC marketting
trap that tries to make you think ALL applications require speed have you?)
will gain from a math co-pro.

^^^^^^^^

that's right, but it doesn't work the other way around(*). I can go look at
Amiga, Mac, or MS-DOG stuff, but not Atari. Why? Because the last shop
that carried Atari folded last year, and no one's bothered taking up the
system. This is in a town of ~180.000 people.
They were also the authorized Commodore-Amiga dealer, but that was quickly
taken over by another shop. It's too bad, because I'd like to be able
to go down and actually compare, say, the Falcon to the A1200, but I can't.
(*) this appears to be true in much of North America, your situation may
be different.

I remember an old (very old) terminal program called PC/InterComm by
Mark of the Unicorn, Inc. That's real what you are looking for.
But it's still not available and not free.
Another good terminal program for vt100 emulation and in the public
domain is uniterm. You can use it with your machine.

Yes, the kernel supports it. None of the GCC libraries have been modified to provide the necessary synchronization locks, though. Not sure if anyone has put it to much use...

>> - memory protection
>> - multiuser support(?, not sure of this)

yes. With the Minix filesystem, file owner and group permissions are also enforced.... Not much you can do about the TOS filesystem, I guess.

Can't believe its an April Fool. The article appeared in the May issue, (don't
ask me why I get it a month early) and it leads with it on the front page
plus a small article near the beginning and then a full blown article further
on. Seems a rather extravagant April Fool if it is.

Grant.

The ST Club carry the ICD utilities, so you can get them for less than two quid (they only run if you have an ICD card). The versions that the ST Club carry are, however, not particularly up-to-date. If you phone them, maybe you could persuade them to update their copy. (However, I habe *never* got anything other than an engaged tone from them).

Sorry, I don't have their number handy; you can look it up in most ST mags.

ph> Atari.

Not really. Atari's market is way too small for NeXT to port NeXTStep to it. They simply wouldn't make enough money out of it. So why should they rewrite anything for our platform. Atari is a niche market, not the market NeXTStep486 is pointing at...

The reason the holes are full of solder is that they were not masked off when the board was flow-soldered. It is a few minutes' work with a solder sucker to clear them.

The Centris 610 and _one_ of the Centris 650 models has the 68EC040,
which makes _no_ difference for normal work. If you're doing heavy ray
tracing, CAD, etc, you'll buy the faster Centris 650 (with the full
'040) anyway... Or at least you'd have the option. Any new Falcon
hardware announcements lately? :-(

So what bugs are there in it at the moment? I bought it yesterday, after hearing someone mention it worked on the Falcon (no point buying software for a computer I expect to have for less than a month), and so far it seems to be working fine. I'm about 40 years from finishing the easiest level of the game (after playing til 5am this morning - ouch!) and I haven't noticed anything yet.

On the subject of it running on the Falcon, the person who mentioned it said that the colors were messed up - am I missing something obvious, or can you not just adjust them with the control panel/whatever?

Kev

5371. How to tell new Falcons from old?

Newsgroup: comp.sys.atari.st
Date: 1993-04-14 13:06:46 UTC
From: a740778@gus.tiuk.ti.com
Message-ID: <C5H5rB.CEF@csc.ti.com>
Source record: 207651

I was leafing through this month's ST Format and saw that several places in the UK are now advertising Falcons, particularly Hisoft, who are just down the road from here. Anyway, recently people have posted that the first Falcons which were available are early revision versions and have inferior performance to the actual production models (someone said production models have 64 mil. pixels/sec. blitter whereas the early versions had the crippled Mega blitter).

So, is there any way I can tell whether a given Falcon is a production model or pre-production? eg. by a serial number or other visible marking on the case? I'm not about to blow 1000 quid on a dodgy Falcon!

Any help appreciated.

I have a nice shareware package I would like to put into one archive (.arc, .zoo, .lzh, .whatever). Problem: files are spread across different folders and this directory structure must remain intact.

Which versions of which archivers can cope with this? What would be the command I would use to archive a file with its folder info? (eg. I suppose X A:\FOLDER\FILENAME.DAT wouldn't do the trick?). I would prefer to use LZH but any archive method will do.

If I need a particular version of an archiver, are there any email servers from which I can obtain that version?

Why don't you try zoo! It's not the easiest one to pack directory-trees
with, but it's no prob depacking into a tree.

You must specify each directory separately on the command-line, so if
your directory looks like:

```
ChangeLog
Makefile
README
/man/whatever.1
/src/whatever.c
/src/whatever.h
/src/atari/tailor.c
/src/atari/tailor.h
```

the command-line should look like:

```
zoo ah whatever.zoo man/* src/* src/atari/* *
```

for zoo to pack the entire tree.

To unpack use:

```
zoo x// whatever.zoo
```

zoo will automagically create the folders for you! :-)

BTW, you need zoo v2.1 to use the HIGH-compression method (the 'h' in 'ah').

Happy packing!

Hmmmm... I thought it was in the GAMES category. But no matter, a _new_
version of the fully playable demo (even 2-player/2-computer mode is enabled)
will be uploaded shortly, along with new demos of Crossword Creator II and
Word Search Creator which have been greatly enhanced. <Thanks, JC> :)

Well, this _could_ be true, but I think your quantities are off by a factor
of 10 according to my rumor-control-sources. And yes, I mean on the downward
side, too. But there is a good side to these delays, too. The TOS version
that will ship (eventually!) with the US Falcons will be more stable than
the early versions that were shipped to Europe.

Lannie, Atari Explorer just released their second issue (Jan/Feb 93) a couple of weeks ago. You should definitely have received one by now so I guess their books are still in a state of disarray. Like everone else at Atari, they are undergoing some "restructuring" so who knows what will eventually happen.

I'll pass your complaint on to Mike Lindsay on GEnie.

Just to let folks know, the latest version I've got is 1.30. (dated earlier
THIS YEAR!) It has some additional features that 1.21 doesn't (although I
can't remember exactly what they are :(I think the ability to define a
default editor is one). I just got it off of GEnie (or was it CompuServe?)

Anyway, if I get a chance this week, I'll try to get it to a.a.

hutch@bellman.lanl.gov (John Hutchinson) says:

>Marty, I wish someone could help you out by giving you a copy of the GFA
>compiler but unfortunately, such action would be illegal. Even though the

How so? The version I had was not 2.0 or 3.0. I believe it was 1.0 or 1.2,
and I got it public domain back in 87-88 to begin with.

>GFA BASIC 2.0 interpreter has been placed in the public domain and the 3.5
>interpreter has been published as an ST Format cover disk, the compilers for
>both version 2.0 and 3.0 remain copyrighted, commercial software which may
>_not_ be freely distributed.

Where can I find any of these newer versions of GFA public domain? And will
my older GFA (non-compiled) code work with them? I have ALOT of programs
I wrote with this old version of GFA I have.

>Contact GFA Software Technologies in the US at 1-800-766-6GFA and they will
>be happy to sell you a replacement copy of the 2.0 compiler. Even better,
>go ahead and upgrade to 3.5 as it is so-o-o-o much better than 2.0. Either
>upgrade will not cost much, you'll be happy and you won't break any laws.

And will all this stuff work on my bare bones early 520-first/with/built/in/
TOS-ST?

>John "HUTCH" Hutchinson
>Fair Dinkum Technologies Member - IAAD
>"No worries, mate... it's from Fair Dinkum!"

Thanks for the reply John. Oh, and another question: The reviews I saw
of the Falcon were for a 10 or 20MHZ Falcon. Did they come out with any
faster ones? And I'm curious as to why Atari chose the 68030 for a new
computer, when that chip was allready old news a long time ago. Why
not one of the newer 68 chips?

Thanks again...

AND ANYONE READING! I still need the compiler help!

Marty

>OK, so it's a question of semantics, then; or how one defines "product
>announcement." Big deal. So shoot me. :)

Ok, so I twist words to suit my point! You read enough of those
slimy market releases and you'd do the same thing!! (and it's *me*
that should be shot!!)

Anyway, no matter *how* you look at it, Apple/Microsoft still do the
same lame things that Atari does. It's that Apple also has some
sterling examples of announcing the LC III and having it for sale
the same day. (But this turn of events is quite recent for Apple
in any event!!) My whole point is, Atari does screw up, and they've
done it many times in the past. *But* if we look at the Falcon
alone...and compare it the Computer Industry track record, Atari is
not doing that badly.

Of course, I think the problem is, that if Atari had got the machine
out in September, it would have had a few months to gain share over
the new Macs, and even longer over the DSP macs,Amiga w/ DSP's.

The Falcon would have looked alot better in September's market than
it looks today--and people know that and I think that makes them
frustrated. And, I do know that Atari is losing Falcon sales as time
goes on. Up to Feb, I would have bought one. I got tired of waiting,
and a good deal for a used NeXT came up...so I took it. I don't think
I'm alone in that regard either (buying another machine that is).

Source record: 207689

It's finally happened, my old 1040 ST has died,

so, I'm selling all the stuff I had with it, if the

prices don't agree with you, please, feel free to let me

know, and, we could certanly agree on something.

HARDWARE

Seagate 251-1 40MB HD ..... $ 90

Supra DMA to SCSI adaptor ..... $ 25
(software included)

Adaptec SCSI to MFM HD controller ... $ 25

All three ..... $ 110

SM 124 Highres Monochrome monitor ... $ 50

All of the above .... $ 130

SOFTWARE (sorry collection, I know)

LaserC Compiler ..... $ 20
(last version from Megamax)

All of the above .... $ 135

BOOKS

Atari ST internals ..... $ 10

Atari St 3D Graphics Programming .... $ 10

Programmers guide to GEM ..... $ 10

And, the culprit:

Free, for the shipping:

1040 Atari St.

All of the above ... $ 150

BTW: buyer pays shipping.

I don't need to make a deal, just get these things out of my house.
(wifes have no sense of humor about "things" and "gray boxes"

hanging around "their houses")

Any gripes, complains or offers, please email me (tight on time)

and or call me (just about any time) at (318) 235-3489.

Thanks,

Pieter,

I, for one, would be happy to honor your request but...

kindly take your illegal phone phreaking gadgetry elsewhere. If you so casually rip off the phone companies I can only assume you'd jump at the chance to pirate software as well. Please don't assume that everyone on the nets possess such low moral standards as those you publicly display.

If that is NOT your intent, do fill us in. I'd love to hear an explanation. In the meantime you might want to check the FAQ.

5392. sound converting program for the ATARI ST/TT/Falcon

Newsgroup: comp.sys.atari.st
Date: 1993-04-14 18:45:39 UTC
From: mppi76@cd4680fs.rrze.uni-erlangen.de
Message-ID: <1qhm4jE32u@uni-erlangen.de>
Source record: 207671

Five to Five V0.9 for the ATARI ST/TT/Falcon

525 is a GEM based sound converter for all ATARI computers, running under TOS and MultiTOS.

525 can convert any of the following formats into any of them:

- DVSM (used by WinRec)
- AVR (used by many ST/TT/Falcon programs)
- AU, SND (used on SUN, NeXT)
- WAV (used on PC's)
- Raw (for many other cases)

You can also convert from 8 bit to 16 bit (and vice versa) and from Mono to Stereo. Also different packing algorithms are implemented.

525 uses the converting routines of the program Fortune V1.0 that only works on the Falcon.

525 will be available at ftp.uni-erlangen.de and atari.archive.umich.edu

Hi Neill.

I use POVray. It's a good raytracer, with sources for Apple, Amiga, PC and

for our loved ST/TT/FALCON.

It's controlled by a programming language like this:

```
// Persistence Of Vision raytracer version 1.0 sample file.
// written by Alexander Enzmann
// Demonstrates box primitive

camera {
location <0 0 -8>
direction <0 0 1.2071>
up <0 1 0>
right <1 0 0>
look_at <0 0 0>
}

object {
sphere { <0.0 0.0 0.0> 2 }
texture {
ambient 0.2
diffuse 0.8
color red 1 green 0 blue 0
phong 1
}
}

object {
box { <-2.0 -0.2 -2.0> <2.0 0.2 2.0> }
texture {
ambient 0.2
diffuse 0.8
color red 1 green 0 blue 1
}
rotate <-20 30 0>
}

object {
light_source {
<-10 3 -20>
color red 1 green 1 blue 1
}
}
```

It renders to 24bit-color-TGA-files.

regards, Jimmy

Hmmm... are you _sure_ it was 1.0? I can't seem to remember them ever coming out with a compiler for the old 1.0 version. If they did, I'm sure it's public domain by now. Anyway, I don't have a 1.0 compiler. To confirm what version of GFA you have, enter the command "PRINT ERROR 100" in the immediate mode of the interpreter. You'll get back a copyright message with the version number.

>Where can I find any of these newer versions of GFA public domain? And will
>my older GFA (non-compiled) code work with them? I have ALOT of programs
>I wrote with this old version of GFA I have.

I'm pretty sure the 2.0 interpreter will not read 1.0 tokenized (.GFA) files. You should still be able to merge 1.0 .LST files into the version 2.0 and 3.0 interpreters, however. Most user groups should have the 2.0 interpreter software in their libraries and it's also probably available on atari.archive. The 2.0 (or 3.0+) compilers are not PD. ST Format magazine published the 3.5 interpreter on their cover disk a couple of months ago. That does not legally make it public domain but there's not much difference, IMHO. Of course, it's pretty worthless without the manual! :)

>And will all this stuff work on my bare bones early 520-first/with/built/in/
>TOS-ST?

Sure, all the GFA versions are compatible with TOS 1.0 and up. Contrary to popular opinion, GFA 3.5 also works with Falcon TOS 4.0+ (although a few things require different methods). It's just not totally MultiTOS compatible.

>Thanks for the reply John. Oh, and another question: The reviews I saw
>of the Falcon were for a 10 or 20MHZ Falcon. Did they come out with any
>faster ones? And I'm curious as to why Atari chose the 68030 for a new

>not one of the newer 68 chips?

The Falcon030 is powered by a 16MHz 68030. My seat-o-the-pants benchmarks show it to be roughly twice as fast as the 16MHz 68000 MegaSTe and 3-4 times as fast as an 8MHz 68000 STe. It depends a lot on what you are using it for. It's most unique feature, of course, is its built-in DSP audio circuitry. Rumor control has it that Atari may bring out a Falcon040 model in a tower

case but that is just wishful thinking if Falcon sales don't hit the big time. I'm sure the decision to go with the 16MHz 030 chip was one of economics, initially. But of course, we can add short-sightedness as a reason now. :)

> [gushing praise of the Falcon]

Oh come on, we're leaving the realm of fact here and getting into dogma
and marketing buzzwords. To wit..

> The Falcon is 3 - 5 times as fast as an ST.

Well, maybe some benchmark ran that much faster. I've been using one
every day for 6 months now. 2.5-3 times as fast would be more accurate.

> [Falcon hicolor demos] that would probably be nearly impossible on
> a 50mhz 486.

Bullshit. My 25mhz 386 in 24bit truecolor mode can run circles around my
Falcon in 256-color or hicolor mode. How? Simple: the 386 machine has a
real graphics coprocessor (TMS 34020) not just a bit-mover that's fighting
the main CPU and the shifter chip for bus access.

> Upgraded blitter chip rated at 64 million pixels per second.

Here's where the marketing hype takes over. The blitter chip is clocked
at 16mhz. That doesn't imply that it can move 16 million bytes or words
per second, or that the other processors on the bus would give it that
much time even if it could. If you take the maximum rate at which it can
pump data, and use the 1-bit-per-pixel monochrome mode as the test case,
you can probably cook up a number like 64million pixels per second. As
the car commercials and other marketing hype experts like to say: your
mileage may vary. Especially if you're not fond of monochrome video.

What Ted Brown said (in post 67515, 14 Apr 93):

I agree 100%, as I'm sure a _lot_ of other users do. As every day without
the Falcon passes by, Atari loses more and more potential market share. And
that's something they desparately need to improve upon. <sigh>

Hello! Are there any available Falcon books yet? Such that are helpful
in programming, something like a Internals for Falcon? If there are,
I'd like to know the ISBN numbers and/or a place to order them from
(and the price, preferably).

I'd also want to know, wherefrom, in the London area, one could buy a
Falcon. I'm asking this for a friend who will take a trip there soon..

>that will gain from a math co-pro.

What apps do I NEED speed from?? Hmm.. None, really... What apps do I WANT
speed from?? All of them.. What apps do I realistically expect speed from??
Most of them..

Here are some examples of things I would like to have faster (and which I
claim will be hit by the Falcon's 16-bit bus). Databases (ok, not that many
available on the Falcon, but I use them on my 386.. I NEED to use databases..
It's part of my consulting job..) What speeds up a database? Fast disk i/o..
AND fast sorting (fast memory/cpu). Most sorting is integer-based..
One way to get fast disk i/o?? Disk Cache (typically 100-200K). Don't tell
me THAT will fit in the 68030's cache..
Compression/Decompression. Again, fast CPU/mem... Fast i/o.. (some programs
take FOREVER to install). IF you want to write the algorithm the DSP might
be able to do this quickly, BUT you still need to get the data to the DSP..
Fast i/o, fast CPU to send data to DSP.. My 33-386 will decompress things
about 8-10 times faster than my 1040.. According to all the processor debates,
it should only be 4-5 times faster (Motorola is much better than intel, etc -
I like the Motorola chip better myself, btw)..

WordPro? Hmm. We're controlling Word through DDE, so we NEED it to give
reasonable performance (ie FAST).
Compilation.. Again - fast i/o (almost all large apps could gain from this),
and fast cpu/mem.. GCC runs on a mega4, but do I want to wait until next week?
NO! (exaggeration intended)

So, it'll take twice as long for the Falcon to calculate the results, but when it's done, it'll update the screen in .01 seconds instead of .1 on a Windows system, and it'll tell me in TrueVoice "I have finally finished"??
WOW!! :-)

The one thing the video will give the Falcon an edge on? Games.. Considering that a lot of people buy machines to play games, this may NOT be such a bad idea.. :-)

>MOST applications requiring speed (you haven't fallen into the PC marketting

PC marketing??? NO - I can't even GRASP the concept of Politically Correct Marketing. "The Horror. The Horror".

SalesDroid(tm Chris H.): "I realize the 486-25sx is somewhat completion challenged, but the 200 meg SCSI drive is storage advantaged, allowing the patience-gifted user to store more data than the price-disadvanted 486-50 & 130 meg SCSI package which might accomplish the user's wishes in a more time-satisfactory duration."

>trap that tries to make you think ALL applications require speed have you?)

Hi I'm new at telneting to the atari.archive.umich.edu machine.

Must I use telnet? or can I used rlogin?

I have tryed telnet and the host asked for a login & password.
I tryed anonymous, but that did not work.

how do I get in?

A sample session would be great.

Thanks,

Fred Saavedra

I find ZOO to be absolutely perfect. But then, I only use archivers from within ARCGSH4.1 which makes everything very simple. The only thing is, if you want to create a new archive, you have to type its name in the file selector that opens up when yoy call Zoo, then choos "add files", then select the files to be included. If you want to include a directory, and all subdirectories, simply enter the directory name at the file selector prompt, since no file selector will let you select a directory without opening it. Then, just hit OK.
Seems simple enough to me!
P.S. I try to avoid LHARC like the plague. Too many incompatible versions around!

It's their loss! I like ZOO, and likewise do a lot of other users.
Especially users that are fond of the Unix programming/filesystem
environment.

: Its near imposible to redirect the out put..

Well, it's not impossible, but I can agree with you that it's not
widely know how to do it.

: I think sticking to LZH201L or the New STZIP 2.2 will be far better,these
: do work on small 520k one drive ST's...

I might do just that the day they can handle full Unix-filename-
compatiblity. Why don't you try packing files with filenames longer
than 8+3 which also is case-sensitive...

Also, it would be a good thing if LHArc (whith the -lh5- method) was
widely available for *ix-systems. However, even though I've looked
for the source I haven't been able to find it. Anyone got it or know
wher I can find it?

: Take it from some one thats tried them all....

FYI, so have I! And hey, no flames please. The last thing we want is
another flamewar.

How about because Atari's pulled a standard Atari trick; the Falcon is NOT
available when it was supposed to be. There is also no do-or-die release
date, and no explanation for the delay.

Oh, and the fact that it's a _slow_ computer, barely able to drive its
own graphics in the 16-bit modes; maybe if they announced _plans_ to
produce faster/better machines, their stock would do better. Why invest
in a company that isn't really producing anything new?

Funny, I thought this 16-bit bus limitation was answered a while ago. Bus width is important but so is bus speed. A 32-bit 16 MHz bus is equivalent to a 32 MHz 16-bit bus. The Falcon seems to have a higher bus speed than 16 MHz to make up for the 16-bit bus. If someone can take a look at the processor direct slot, we might find out how fast the bus is actually going.

You should really try and comprehend what a DSP is. Especially, like, how
are you going to use a 24-bit integer math DSP for DTP, and how can that
possibly make the programs better? Aside from realtime 16-bit audio stuff,
I can't think of anything that this would really help at, primarily
becaused the 5600X DSP's are integer-math only.

>I, for one, would be happy to honor your request but...
>kindly take your illegal phone phreaking gadgetry elsewhere.

Hi John,

Now WHY am I not surprised to hear this one from YOU, eh :).
The mere thought I owe you an explanation makes me giggle,
but anyways, here's some facts:

* I live in the Netherlands. Somewhere between March '92 and
December '92 I developed my beauty, during which time
phreaking was not only LEGAL here, yet even demonstrated
and discussed on national radio by a Dutch H/P magazine editor,
his roommates, one spokeswoman and two techical experts of the
Dutch Telecom (PTT), the latter applauding them for tracking
flaws in the system - a mental climate FAR from the nervous
one ruling both your home country and your mind.
(It even got better: A COMPLETE phreak-sequence has been
broadcasted at the end of the program whilst the audience
at home was instructed to record it on a music-tape.
It connected for free to the White House. (VPRO Radio, 3-5-'91)
Weeks later they still turned down any call upon hearing the
keywords 'Dutch', 'Holland', or 'The Netherlands':)
John's facial expression swaps from grave to sheer horror
Okay. Sofar for smalltalk.

* Indeed: since March '93 new computer crime laws also enable punishment
of phreak activities. Bad news, game over, time to change to
other hobbies (wanna trade stamps with me, John?:).
Still; spreading a dialer that could be re-programmed to sing your
national anthem, yet happens to be preset with in-band signalling
systems (and more!) is simply NOT illegal.
The user is solely responsible for the use of it, as it says in the
disclaimer. It can even serve YOU for storing and speed-dialling
up to 99 relatives and friends. *what a waste*

>If you so casually rip off the phone companies I can only assume
>you'd jump at the chance to pirate software as well.

* John, John. If you call THAT a train of thought, railroad accidents
must be your favorite. Apart from that, I could start explaining
the bottleneck of tollfree #'s, the way telecompanies bill eachother,
the shamelessness prices asked for international traffic and the
economical laziness monopolies yield (non-USA telcom's) etcetera -
but that'd better be taken to private mail.

>Please don't assume that everyone on the nets possess such low moral
>standards as those you publicly display.

You're cute when you're upset :).

>If that is NOT your intent, do fill us in. I'd love to hear an explanation.

And I mean *really* cute.

>strange if you're into phreaking). Maybe you should have a look at his
>dailer (if he lets you have it ;-) before you publicly announces yours to
>be the most complete.

Hi there Daniel?

Not only do I KNOW Zaphod,
he also granted me free DL, unlimited session time and Elite access
on his ICS HQ board Eagles Nest halfway January '93 (as did Troed for
his Sarcastic Existence BBS - they might inform you why)
- which must be about the time I leached his dialer as well.

Oh well: "To err is human" sort of fits in here ;-). I guess you
haven't hooked up to MegaNet lately, so here are the specs of the
Rowdy Dialer again:

* DTMF
* CCITT 3, 4, 5/R1
* R2 forward and backward
* Red-/greenboxes
* ATF1 (B-Netz) signals
* Tone slots
* Line- and other signals

all preset under 10*16 MF-keys and up to 99 songs and fully user
definable wrt frequencies, timings and volumes, and features a.o.

* number scanning
* guard banding
* sweeptest
* frequency stepping
* advanced song programming/invocation
* preprogrammable songkeys (10*10)
* direct mark time/volume stepping
* pasword protected key logging
* program execution

presented through a luxurious graphical interface,
and step-by-step introduced in a clearly written 20 page manual.

(which btw is nothing BUT a user manual !)

Enjoy!
RowdyB

The way I go about it is using a combination of GemView
(a marvelous program) and some desk accessory (like James) for
instance that intercept the ALT-HELP combination and saves the
screen as a PI2 or PI3 picture according to current screen resol-
ution. Some AUTO programs do this also. Gemview will allow you to
import all kinds of images (GIF TIF IFF TIFF JPEG and lots more)
shrink them, stretch them, sut them, anythingthem! Simply request
a full screen view, MOVE THE MOUSE out of the picture (I keep for-
getting to do that) then do ALT-HELP and presto, you have your
dream picture.

Hey, I have a GEM of a Computer not a Unix workstation, tell me how do I use
Unix file names on my ST or E..

Unix on Atari computers must be a BIG JOKE, here no one uses it, so why not
houses for cources, the Atari range of computers were built with a built in GEM
a simple GUI far better than a command line thing..

ZOO is definitely not for the first time user, its the only one that I have
problems with and even with a shell to drive it, and note, I have had a ST
since 1986 and have been in Computers for some 20 years or more..

ZIP 2.2 would be the easyest one to use, has a nice GEM interface that does help
a lot, and LZH201L has all the Features that ZOO has and more, will extract
multible files and will let you create folders that are not there to extract
to, has a simple way to set the base directory when archiving files that are
deep inside folders, LZH will allso extract, creating directories with out
having to enter a command at all, you just pass it the file name and the
optional destination (Note, Drive as well), if the destination folders are
not there they are created...

There is one bug with LZH201L, its the Time and Date, with TOS 1.0/1.2 it will
reset time/date to the current time and date of extracted files, this can
be fixed with a TSR...

So Please, we are all not Unix freeks that use Internet/Usenet,
so Please keep your bad habits to your self..:-)..

Hmm, looks like they're shipping the improved version, as I don't get any of them. OTOH, there are still some problems:
There appear to be some corrupt pictures (I must check the disk files with a suitable viewer and see) as some of the later popup pictures (eg, Americans end war with French, etc) are corrupt
The 'xxxxx have built a space ship' screen has the text running off the RHS of the screen, and finishing on the left a line down.

Nothin major though, so I'm quite pleased

> (Not nearly as good as the PC version, but hey, it was a rush-job, and
> we nearly didn't get it, so I'm not complaining!)

True, true. I'm not sure whether I've spent so long on it because its such a good game or because its the only decent game I've seen in ages (first time I've used the color monitor in a good 8 months, apart from viewing GIFs). I hear they are doing an upgrade to use the enhancements on the A1200, so who knows, perhaps they'll do something similar for the Falcon. Well, I can hope.

Kev

> every day for 6 months now. 2.5-3 times as fast would be more accurate.

There's the incriminating admission that was missing from Ian's
benchmark test. He has a developer's preproduction Falcon that
is substantially slower than the production models. Readers here
may remember that Atari did not start shipping the latest revision
(rev. 4?) until the latter part of December 1992. Ian, in fact,
may possess the model that was exhibited at Atari Messe/Comdex
which were definitely the 'wait-stated' units.

I don't want to say Ian is wrong in publicising benchmarks and
remarking about a machine that was still in development (though
DEC employees PLEADED with people to refrain from benchmarking
an ALPHA system that was open for public use, because it wasn't
prepared for those measures) but he or anyone else should make
clear which revision Falcon they are testing. What could be
more fair to readers simply interested in facts rather than
fallacy?

> the main CPU and the shifter chip for bus access.

Interesting to know that the 34020 is standard equipment in PCs.
Let's accept your claim. I want to use a graphics application

that requires a 10 MB 16-bit colour map that I am able to scroll at high speed. Let's see your 'real' computer handle that.... and also try emulating a DX-7 synth at the same time, just for fun. I suppose that 34020 is useful for all the PC games that support it too.

You see Atari had no /intention/ of creating a dragster; they made the world's most 'sportiest' computer. For reckless speed does not always win, in a world full of curves.

I've had reports of it crashing with Tos 1.2. The problem appears to be
some interaction between the Tos 1.2 IBKD handler and my custom MIDI handler
but not having access to a Tos 1.2 machine I've never been able to pin it down.
If someone can send me a detailed bug report (ie with disassembly from arround the
crash site so I can identify the code) I'll take another look at it.

When I think about it you might be right. :-) I own an Atari and not a
Unix workstation. However, the filename-thing has really nothing to do
with wether it's a workststion or not, it's just a matter of filesystem-
improvement/replacement.

Another example of improving things: Any program that won't run under
TOS 2 or higher will be called incompatible and will be rejected by a
good number of Atari-owners. The program is running _on_top_ of the OS
(just like the packer runs on top of the filesystem (and the OS)). Why
shouldn't we demand that programs must handle new and improved file-
systems when we demand that they should run on any TOS-release? The
Minix filesystem has been around for a VERY long time now. I think it's
time to demand that TOS too handles it correctly! :-)

: Unix on Atari computers must be a BIG JOKE, here no one uses it, so why not
: houses for cources, the Atari range of computers were built with a built in GEM
: a simple GUI far better than a command line thing..

I'm of the opinion that a mix of GUI and CLI is the best way to go.
Right at this moment I'm running MultiTOS with TOSWIN and I _love_ it.
I also got a 85 meg HD with 3 partitions. One boot-partition with the
old filesystem, and two 32-meg Minix-partitions filled with GNU- and
Unix-utilities and also a good number of Atari-specific stuff (like
Devpac :-). If you're serious about your computer and wants to do some
developing in a Unix-like (note, Unix-like is NOT the same as Unix)
environment then you have no real choice but to use Minix-partitions.

And hey! Don't say no one uses MiNT, because lots of people do!

Also, yesterday I installed Stephen Usher's init-package which gives
me the opportunity to have a multi-user system at my hands. Try
setting owner- and group-privs on a TOS filesystem. It's impossible!

: ZOO is definitely not for the first time user, its the only one that I have
: problems with and even with a shell to drive it, and note, I have had a ST
: since 1986 and have been in Computers for some 20 years or more..

Well, you beat me there. I'm only 21! :-)

: ZIP 2.2 would be the easyest one to use, has a nice GEM interface that does help
: a lot, and LZH201L has all the Features that ZOO has and more, will extract
: multible files and will let you create folders that are not there to extract
: to, has a simple way to set the base directory when archiving files that are
: deep inside folders, LZH will allso extract, creating directories with out
: having to enter a command at all, you just pass it the file name and the
: optional destination (Note, Drive as well), if the destination folders are
: not there they are created...

Then again, where's the support for filesystems with more than 8+3
case-sensitive filenames??? ;-)

: There is one bug with LZH201L, its the Time and Date, with TOS 1.0/1.2 it will
: reset time/date to the current time and date of extracted files, this can
: be fixed with a TSR...

Nobodys perfect! ;-)

: So Please, we are all not Unix freeks that use Internet/Usenet,
: so Please keep your bad habits to your self..:-)..

Bad habits??? I'm just talking about some compatiblity (look at the
example above). When (and if) there's a ZIP- or LHArc-program for the
Atari that correctly handles the Minix filesystem you might be able
to pursuade me into leaving ZOO, but until then... though shit man! :-)

Happy packing!

Atari did something right when they didn't ship the machine before it worked
properly. Unlike CBM who has forgot a codensator in every A1200 produced
before week 10, and if we are to belive all the braging of the amigans there
were about 50 000 units were by that time sold in Great Britain alone.

Hmmmm, thats 50 000 motherboards that needs soldering on a little thingy. I
guess thats for free just like all the add-on boards that A1200 owners need
to buy to get close to the Falcon 030 power. Another thing... it seems to be
problems with the A4000 too. Everyone that I know of who has bought one has
had to return the motherboard for some reason or another.

Boy CBM is sure great they don't have delivery problems.....but their
products sure suffer from a rush-job. Forgetting condensators.....and
amigans talk about Atari blunders.

Well this time it was Commodore who f@$ed up..... BIG TIME

Greetings

Rune Hyldmo, anti sig.file activist

I would like to buy a second-hand Atari SM124 mono monitor. Must be in excellent functional condition; cosmetic condition of casing unimportant. Leads & plugs must be included.

I'm willing to pay around 40 UK pounds cash, and will collect from anywhere in Central England or Mid Wales. Obviously, I'd like to bring along my ST to check things out before I hand over the reddies!

Email please or 'phone me on Warwick (0926) 464830 (answering machine out of office hours).

5438. Mac floppies under Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1993-04-15 15:04:58 UTC
From: gt1448b@prism.gatech.EDU
Message-ID: <93086@hydra.gatech.EDU>
Source record: 207517

Should Spectre GCR have trouble reading Mac floppies? I recently purchased a used GCR and have trouble reading Mac floppies. Sometimes all that is required is to reinsert the disk a few times. Other times I have to juggle through several Mac disks before it will read the one I want opened. Some just can't be opened. I get a variety of errors, sometimes I'm asked if the disk should be formatted, other times I get a partial listing of what is on the disk. Sometimes it's write errors (after successfully reading from the disk). At first I suspected my Mega STE floppy B port, but I can't even format a Mac disk on a 1040ST with a known good floppy B port using this Spectre. Everything else about Mac emulation seems to work fine.

<<< rampant rationalizing deleted >>>

Pieter, you display the classic symptoms of a deluded person who spends the majority of his waking hours trying to rationalize his illegal activities. And boy, you are _really_ good at it too, as you seem to have thoroughly convinced yourself that because the phone companies charge exorbitant rates, that makes it perfectly legitimate for you to steal from them, e.g.:

> the bottleneck of tollfree #'s, the way telecompanies bill eachother,
> the shamelessness prices asked for international traffic and the
> economical laziness monopolies yield (non-USA telcom's) etcetera -

Hmmm... where have we heard this logic before, folks? "XYZ software company charges too much for their software so it's OK to pirate it."

> You're cute when you're upset :).

I'm not paranoid, Pieter. But I admit your reply does bother me. It bothers me to know that you openly display such little regard for the rights and property of others. It bothers me to see such posts here in c.s.a.s. because I am an Atari software developer. And it bothers me because at least so far, no one else has taken exception to your post. Perhaps I am all alone in this regard and if such is the case, I'll cease and desist (albeit sadly).

Phreaking is illegal. It's a theft, as is the piracy of software. I don't like thieves and I don't like those who openly promote illegal activities. If you had taken the time to note the potential LEGAL uses of your dialer or made even a thinly veiled attempt to denounce telephone theft, then...

I hate to waste any more bandwidth, but I really would be interested in how other newsgroup readers feel about this. If everyone feels this kind of thing is OK, then I'm obviously misplaced here, and I'll leave you to it.

5443. Re: Mac floppies under Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1993-04-15 18:50:36 UTC
From: L676791@LMSC5.IS.LMSC.LOCKHEED.COM
Message-ID: <93105.42636.L676791@LMSC5.IS.LMSC.LOCKHEED.COM>
Source record: 207529

Don't feel bad, you are not the only one who has problems with Spectre GCR. Spectre has plenty of bugs, and difficulty in reading Mac disks from time to time is one of them. One thing you might try is to format a disk in Mac format while still in the Atari mode (single sided seems to work, and it's quicker). Then go into the Mac part of Spectre GCR, and usually the problems with reading Mac disks go away. If Spectre GCR causes a grinding noise on one of your floppy drives, don't despair, you are not alone. This is common. It hasn't hurt anything yet, but it sure sounds nasty. There are plenty of other bugs too numerous to mention here, but just in case anyone out there plans to buy an Atari with the idea that you can have a flawless Mac emulation, think again. You will most certainly have problems, and by my experience, no support from Dave Small of Gadgets by Small. So you are basically stuck with a piece of equipment put out by a virtual one man operation who doesn't seem to want to support his customers. Yes, Dave Small apologists, I know you are out there, ready to jump to his defense and flame me for denegrating your hero, but the fact is that Spectre GCR is hopelessly outdated (it only runs system 6.5 or below) comes with a poorly written, incomprehensible manual, and doesn't have the basic facts necessary, such as the fact that a 1.44 meg drive won't work with Spectre GCR. So, if those of you out there are considering buying an Atari which will become a Mac with Spectre GCR, take my advice. BUY A MAC INSTEAD! If you already own an Atari, and find you need a Mac at home for your work, Spectre GCR can be somewhat helpful. For example, you can install an OLD version of Microsoft Word (like 3.2 or 4.0), and write text at home, and bring it into work on disk, and if you have Microsoft Word 5.0 or 5.1 at work, you can read 3.2 or 4.0 files. However, you CANNOT read Microsoft Word 5.0 or 5.1 files with Microsoft Word 3.2 or 4.0, so you can't take stuff done on the latest version of Mac Software and make it work on an older version. Only vice versa. And here's the kicker. Spectre GCR is by now so ancient, it will only accept OLD versions of software like MS Word or Aldus Pagemaker. Try finding those anywhere. In fact, try going to a Mac dealer and purchasing sytem 6.5 or 6.4 system/finder. YOU CAN'T! They don't sell them anymore. So in essence you must be a pirate by necessity. If anyone cares to jump to Dave Small's defense, be my guest. He never once got back to me or the dealer who was trying to help me get my damned thing working when I bought it six months ago. I know, I know -- he had family problems. Does this mean he just drops support to all of his paying customers? What about hiring a secretary or something? I welcome any response to this posting.

You mean, besides Dave Small and Jim Allen? No one else has bragged about one here, so maybe not. Then again, we don't get very up-to-date news about what German folks have hacked up...

> it? I know TOS 1.0-1.6 has problems with the '030. Will TOS 206
> work on the '030? Since both Dave Small & Jim Allen have such boards
> and they both licensed TOS 2.06 from Atari, does that mean TOS 206
> used in their board has been altered to work with the 030?

TOS 2.06 was written specifically to be compatible with all STs and 680x0 processors. The ROMs that come with Dave or Jim's accelerators are the same as you get from Atari or any other distributor (e.g. Codehead...).

Getting a 68030 running in an ST isn't easy, but if you want to try it, call up your Motorola literature office. They have app notes on fitting 68020 into 68000/68010-based systems, and notes on fitting 68030 into 68020 systems. From these docs you should be able to determine the best approach...

Actually, I take exception to some one openly advocating theft. And I might would have replied sooner. I just didn't know that the term for this particular form of theft was called phreaking. (I guess I just live a sheltered life, or maybe I'm just too busy finishing up my Ph.D.) I don't like theft because, as a consumer, I end up paying for his theft. You don't think the phone company is just going to eat this cost, do you?

You Probably can't do more than a base of 640. The limitation is in DOS not the 386/486 architecture. As Stated the rest will probably be XMS and EMS memory.

>have inferior performance to the actual production models (someone
>said production models have 64 mil. pixels/sec. blitter whereas the
>early versions had the crippled Mega blitter).

All current Falcons which we have a real live production models with TOS
4.02 fitted (the latest ROMed version - OK so they're OTP EPROMs), indeed
we've never sold any pre-production ones. If you're interested please feel
free to give us a call.

>You must specify each directory separately on the [Zoo] command-line [...]

I don't think so, not with the Atari version at least. I believe that
the command:

zoo a// ...

will recursively add the contents of subfolders. Currently this is
specific to the Atari version, but I recall hearing that it was passed
on to Rahul Dhesi (or whoever is the final arbiter of things Zoo-y) for
inclusion in the next version.

> Ian ... has a developer's preproduction Falcon that is substantially
> slower than the production models.

I hate to burst your smug little bubble, but I in fact have *two* Falcons onsite here, a preproduction model and the more recent release you allude to which I received during the last week of December 1992.

The main difference between the two machines is that on the earlier model, memory accesses required 5 CPU cycles, on the later release they take 4. In practice, there is only a very small noticible difference in the speed of the two machines.

I was also accused of unfairly benchmarking the Falcon. In fact, I did no such thing. I specifically repudiated a prior mention of benchmarks (which as we all know are pretty worthless) and gave instead my general impression of the machine, based on the fact that I've been sitting at one and *using* it for 16 hours a day, for quite some time now. Over 4 months on the latter-model Falcon, over 6 months if you include my prior experience with the pre-production model.

Don't get me wrong, the Falcon isn't a bad machine. But it's also not comparable to a 486/50, not even close. What it is close to in many ways is my 386/25 system, when running in text modes and doing non-graphics things. The fact that the Falcon can get about the same amount of work done in text mode as a machine running almost twice as fast is pretty impressive, really. But in terms of graphics work, it lags far behind the capabilities of the mid-line 386 systems. (And as the programmer on the team for Autodesk Animator Pro who wrote all the video device drivers plus a fair amount of the rendering code, and also as the sole programmer currently working on Cyber Paint for Atari machines, I feel that I'm in a pretty good position to judge the relative merits of graphics processing between the two platforms.)

> the best archiver

I have to agree that ZOO is the lamest of the available archivers, and should be shunned by all thinking people.

LZH201L is good, it's what I use the most. The only problem is has is that it isn't very compatible with its MSDOS cousin. I frequently port source code back and forth between my Atari and MSDOS machines using LZH201L, and if the archive was created on MSDOS, then on the Atari side the 'f' and 'u' commands don't work well at all. It makes wholly bogus decisions about what files are out of date; apparently something about the timestamps in MSDOS LZH archvies confuses it.

It's also a bit annoying (I think) that the Atari version is so facist about keeping the files in alphabetical order in the archive. If I add a file on the MSDOS side, it doesn't get put in alphabetical order by the MSSDOS LHA program. If I then take the archive to the Atari side and do an 'f' or 'u' on it, the non-alphabetical entry confuses it, and it tends to add all the files to the archive again, putting duplicate copies in the archive.

Even with these problems, it beats the heck out of ZOO, though.

Like you, the point where I won't consider sending money overseas is where the banks get too big a chunk of the money. When I paid for Hermes, I looked into the different ways of getting the money to martin. The options were basicly bank check, electronic funds transfer, or cash. mailing cash is too risky for my tastes. EFTs to martin would cost me 25$US to send (roughly) 40$US. A bank check cost me 1$US and cost martin about 10$us in bank fees if I remember correctly. martin went through a mild hassle with the bank but he got his 60DM shareware fee and a little extra.

If you (or anyone else for that matter) are sending money to another country, make sure you cover all fees for the recipient of the money so that they get all the money that they have comming to them. An example of the kind of trouble you can get into involves a telescope making journal I subscribe to. The journal costs roughly 20$US/yr. The latest issue carries a tale of recieving 20$OZ for a subscription and by the time the bank was through with it, the journal had 5$US and the australian still needed to send more money.

I have found enough neat german software that I am considering opening a german bank checking account, stuffing about 200-300$ into it and paying for shareware from that account. banks would get a *lot* less money from me that way. :-)

another way of dropping the cost of paying for international shareware is to get a bunch of folks together and send in your group payment in one check.

A third way of getting shareware money is by barter with a trusted agent. for example, I would like to get some of the "Footrot Flats" series of books and I would consider these books currency exchangable for US shareware dollars. (email me for details if anyone can help)

I hope some of these ideas help encourage folks to send more money to shareware authors overseas.

It'd be amazingly nice, but I'm not holding my breath.

>: Unix on Atari computers must be a BIG JOKE, here no one uses it [...]

Translation: you don't _know_ anyone there that uses it. All that
means is that you don't know enough Atari users.

>: [...] the Atari range of computers were built with a
>: built in GEM a simple GUI far better than a command line thing..

I used to think so, too, until I started _using_ one on a regular basis.
Until I started building shell scripts that would, say, unpack an
archive, examine all the newly unpacked files, trim off the news headers
at the top, run them through a couple of text processing filters to trim
off the superfluous stuff, and pack them all back into the original
archive -- and then looked at my GUI and realized that it would take me
almost an hour of mindless tedium to do the same thing.

>I'm of the opinion that a mix of GUI and CLI is the best way to go.

Pretty much, though the jury's still out on the appropriate ratio.

>And hey! Don't say no one uses MiNT, because lots of people do!

Here's one more.

>: ZOO is definitely not for the first time user, its the only one that I have
>: problems with and even with a shell to drive it, and note, I have had a ST
>: since 1986 and have been in Computers for some 20 years or more..

Roger, I have to ask this, just so I know the sort of person I'm talking to. You say you've "been in computers for 20 years". In those twenty years, what have you been _doing_ with computers? Have you mostly been using canned applications (word processors, spreadsheets, games, MIDI stuff, telecomm, what have you), or have you been _making_ applications, programming? In other words, are you a user or a hacker?

I think it's fair to say that Zoo is to some extent a hacker's archiver. It does demand a bit of sophistication on the part of the user, in exchange for which it provides a great deal of flexibility and bullet-proofing. After all, Zoo runs on a lot of platforms, so many of its users are going to be real "power users" that will _demand_ that level of performance.

For the user, LHArc is fine -- just type the command and go. Just don't expect it to handle the corner cases (a few of which I describe below). On the other hand, about the only thing a user is likely to do with an archive is extract it, and for that, there are stripped-down versions of Zoo (I'm thinking of Booz here) that are just as easy to use as LHArc. If you're _creating_ archives on a regular basis, it's likely that you're involved in some kind of program design or development -- that is, you're a hacker, and Zoo should be right up your alley.

>: ZIP 2.2 would be the easyest one to use, has a nice GEM interface that
>:does help a lot,

Not on any other computer, it won't. Some of us need to be able to manipulate archives on systems other than our Atari at home, Roger. Not all of us are GEM freaks; try to keep your bad habits to yourself ;).

>Then again, where's the support for filesystems with more than 8+3
>case-sensitive filenames??? ;-)

And understanding '/' as a path separator, and other assorted friendlinesses.

>: There is one bug with LZH201L

Ahem. You obviously haven't tried using it with MiNT. Just in brief usage, I've found two major unfriendlinesses with LZH201L:

- '/' is used as a command switch. I found this out when I tried to copy a .lzh archive to my RAMdisk and expand it from there:

lharc x /tmp/fred.lzh

LHArc was not happy about this.

- It steals all available memory. This may not seem to be a problem, until you try:

lharc p fred.lzh read.me | less

If the lharc process starts first, there's no memory left to start the less process. This is a _really_ obnoxious thing for a program to do, and would almost be enough to turn me off on LHArc even in the absence

of other problems.

Daniel's closing comments pretty much sum up my opinion:

> [...] When (and if) there's a ZIP- or LHArc-program for the
>Atari that correctly handles the Minix filesystem you might be able
>to pursuade me into leaving ZOO, but until then... though shit man! :-)

In fact since the Atari line has no actual text mode (like the PCs do, in hardware) then the Falcon in text mode is still doing graphics! So you can be even more impressed by the Falcons ability to get the same amount of work done in text mode as a 386/25 (since the Falcon is really doing 'graphics').

Hey, people that think can make their own decisions, right? People like me will, whatever you say or think, use ZOO anyhow since it fills our needs. Neither LHArc nor ZIP does! If that by your definition makes us 'non-thinking-people' then it's you who doesn't think! Think about it! :-)

[stuff about LHArc removed]

: Even with these problems, it beats the heck out of ZOO, though.

Q. By who's definition?
A. By Ian's definition!

It's a matter of what you want from an archiver. If you are satisfied with what LHArc gives you, then by all means use it. If you, on the other hand, feel ZOO gives you the best value/diskspace-ratio then use that instead. In my little 'non-thinking' world I would never use an archiver that truncates some of the filenames when I'm playing around in my Unix-like environment.

Happy thinking! ;-)

Hmm, sounds like you, in a matter of hours, have become a doctor who
knows everything there is to know about 'phreaking-symptoms'. Could
you please list those symptoms so that everyone on the net can spot
a phreaker just by reading his mail, please! ;-)

: And boy, you are _really_ good at it too, as you seem to have thoroughly
: convinced yourself that because the phone companies charge exorbitant rates,
: that makes it perfectly legitimate for you to steal from them, e.g.:

I agree that phreaking is a way of stealing from the telco. However,
the human isn't perfect. We could start to discuss valuations and stuff
like that, but since every person on the net has his/her own morale/
set of values it wouldn't be of much interest. Maybe you've got a
higher morale than Pieter, but who's to judge. Phreaking is a big
sin for you, but for him it might not be that bad. Also, he might
think that something you do is a big sin, but for you it's nothing.

: Hmmm... where have we heard this logic before, folks? "XYZ software company
: charges too much for their software so it's OK to pirate it."

I really think you're jumping to conclusions here. Pieter didn't even
mention software theft in his original post. What you are doing is
something that I think is quite ugly, categorizing(sp?)! Obviously you
think every phreaker is a software pirate, which is NOT the case!

: I'm not paranoid, Pieter. But I admit your reply does bother me. It bothers
: me to know that you openly display such little regard for the rights and
: property of others. It bothers me to see such posts here in c.s.a.s. because
: I am an Atari software developer. And it bothers me because at least so far,
: no one else has taken exception to your post. Perhaps I am all alone in this
: regard and if such is the case, I'll cease and desist (albeit sadly).

You're of course not alone, but I _do_ hope you're the only one who
thinks phreaking is the same as software theft! It's NOT!!!

: Phreaking is illegal.

So is tons of other stuff people do every day. If you think really hard
I'm sure you will find that you too do something illegal every once in a
while.

: It's a theft, as is the piracy of software. I don't
: like thieves and I don't like those who openly promote illegal activities.
: If you had taken the time to note the potential LEGAL uses of your dialer
: or made even a thinly veiled attempt to denounce telephone theft, then...

When (if?) you do something illegal, do you feel like a criminal?
When I'm driving too fast I sure as hell don't feel like a criminal.
The morale is shifting from person to person. It's SAD BUT TRUE
(Metallica, yeah!)! In a perfect world we wouldn't even know of the
word morale 'coz everone would have _perfect_ morale. In a perfect
world communism might have worked very well. Unfortunately we're NOT
living in a perfect world...
(hmm, this wasn't a very good argument, but I'll leave it in anyway :-)

: I hate to waste any more bandwidth, but I really would be interested in how
: other newsgroup readers feel about this. If everyone feels this kind of
: thing is OK, then I'm obviously misplaced here, and I'll leave you to it.

You're not "misplaced"! You're just jumping to conclusions. I don't
like it, and I'm sure you wouldn't like it if someone said: "If your
name is John you must be braindead, 'coz so every John I know!".

Have a nice day!

Does anyone know of programs that use the FPU? I have a Mega/STE 4 50
and am considering getting one if any of the programs I use use it...
do some everyday utils (like LZH) and other utils use it? art stuff...
word processor stuff? etc... thanx!

-Kev Atari Mega/STE 4 50

5462. Falcon programming documentation (OS & Hardware level)

Newsgroup: comp.sys.atari.st
Date: 1993-04-16 01:00:29 UTC
From: jmccoull@bruny.cc.utas.edu.au
Message-ID: <jmccoull.734922029@bruny>
Source record: 207546
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

[all replies via email if possible, I'll post a summary if the need arises]

Hello! I am posting to these news groups for a friend of mine who just bought a Falcon030 (first one in Tasmania/Australia :)). Anyway I'm an amiga coder myself so I dont know much about how the falcon documentation works, but if anyone has some documentation they can send to to send to my friend (Cepheus) it would be thankfully recieved!

Anyway If i recall the Atari ST's have a BIOS style OS interface so a list of trap numbers and registerized parameters and control blocks would be nice.

Basically I'm after any falcon programming docs:

- Operating system docs & include/definition files.
- Hardware level programming (register maps etc...)
- Maybe some docs on cycle counting for a 32 bit 68030 on a 16 bit memory interface. [ie how do the memory transactions work!]
- Also information on the exact nature of the 32 bit wide [dma/graphics and sound system] bus would be nice, so he can work out slow downs etc...

Thankyou for your time.
Regards, James McCoull.

PS. No lectures on hardware bashing over OS programming please. These docs are headed for a professional Software Engineer who likes a little fun when he is not working professionally.

PPS. Surely someone must have hardware docs on the register set? I already have similar docs for the A1200 [lame yes], and CBM dont even release these!

5463. Re: Archivers which can cope with directories

[Apologies if you've already seen this; it never showed up at our site.]

From the Holy Book of <1993Apr14.142630.16552@tdb.uu.se>
as spake by m91der@tdb.uu.se (Daniel Eriksson) :
>You must specify each directory separately on the [Zoo] command-line [...]

Not on the Atari version. As of v2.something, you can use the `//'
option with the `a' command to recursively add the contents of
subdirectories. This isn't, unfortunately, a feature of the main Zoo
distribution, though it has been submitted to the final arbiter of all
things Zoo-y (Rahul Dhesi?) for inclusion in a future version.

> [...] so if
>your directory looks like:
>
> ChangeLog
> Makefile
> README
> /man/whatever.1
> /src/whatever.c
> /src/whatever.h
> /src/atari/tailor.c
> /src/atari/tailor.h

you can simply use:

zoo ah// fred.zoo *

From the Holy Book of <1993Apr15.101112.939@tdb.uu.se>
as spake by m91der@tdb.uu.se (Daniel Eriksson) :
>sheppard_r@kosmos.wcc.govt.nz wrote:
>: Hey, I have a GEM of a Computer not a Unix workstation, tell me how do I use
>: Unix file names on my ST or E..

Two words, Roger: Minix filesystem.

> [...] Why
>shouldn't we demand that programs must handle new and improved file-
>systems when we demand that they should run on any TOS-release?

And bear in mind, MiNT is pretty much part of the operating system now.
If LHArc can't handle that, it's going to be in for trouble.

> [...] The
>Minix filesystem has been around for a VERY long time now. I think it's
>time to demand that TOS too handles it correctly! :-)

I'd be overjoyed, but I'm not holding my breath.

>: Unix on Atari computers must be a BIG JOKE, here no one uses it [...]

Translation: you don't _know_ anyone there who uses it. All that means
is that you don't know enough Atari users.

>: [...] the Atari range of computers were built with a
>: built in GEM a simple GUI far better than a command line thing..

I used to think so too, until I started using a CLI on a regular basis.
Until I started writing shell script that could, say, unpack an archive,
select from the newly created files those that contain certain keywords,
strip the mail headers from these, pass them through a few text filters
to get the formatting right, and pack them all back into the same
archive, in a single command -- and then looked at my GUI and realized
that the same task would require hours of doing essentially the same
thing over and over. I thought computers were supposed to _free_ us
from mindless tedium. ;)

>I'm of the opinion that a mix of GUI and CLI is the best way to go.

Exactly. Joe User doesn't want know all the ugly details required to
get his spreadsheet to balance, and a GUI is the perfect thing to hide
them with. On the other hand, if you want access to the nuts and bolts,
a GUI tends to get in the way more than anything.

>And hey! Don't say no one uses MiNT, because lots of people do!

Here's one more.

>: ZOO is definitely not for the first time user, its the only one that I have
>: problems with and even with a shell to drive it, and note, I have had a ST
>: since 1986 and have been in Computers for some 20 years or more..

Let me ask you something, Roger, because I need to know what kind of person I'm debating with. What do you actually _do_ with computers? Do you mostly run canned applications (word processors, spreadsheets, MIDI stuff, games, what have you), or do you get your hands dirty and do some programming and developing? In other words, are you a user or a hacker?

I think it's fair to say that Zoo is to some extent a hacker's archiver. It does expect a bit of sophistication from the user, in return for which it provides great flexibility, consistency and bullet-proofing. It has to, because it's available on several platforms, and therefore many of its users will be real "power users" that _demand_ that level of performance.

For the user, LHArc is fine -- just type a command and go. Don't expect it to handle the corner cases, though (a few of which I detail below). On the other hand, the only thing a user is likely to do with an archive is extract it, and there are stripped-down Zoo extractors (I'm thinking of Booz here) that are just as easy to use as LHArc. If you find yourself _creating_ archives frequently, it's likely that you're involved in some kind of program development -- in other words, you're a hacker, and Zoo is right up your alley.

>: ZIP 2.2 would be the easyest one to use, has a nice GEM interface
>: that does help a lot [...]

Not on another computer, it won't. Some of us need to be able to manipulate archives on systems other than our Atari at home -- for instance, to check it out before spending a few hours downloading it at 1200 baud. Not all of us are GEM freaks, Roger; try to keep your bad habits to yourself. ;)

>Then again, where's the support for filesystems with more than 8+3
>case-sensitive filenames??? ;-)

And using '/' as a path separator, and easy search of the archive directory structure, and intuitive handling of archived directories in general, and other assorted friendlinesses.

>: There is one bug with LZH201L [...]

Ahem. You obviously haven't tried using it with MiNT. Just after brief use, I've found two major problems with LZH201L:

- It uses '/' as a command switch. I discovered this when I tried to copy a .lzh archive to my RAMdisk and extract it from there:

lharc x /tmp/fred.lzh

LHArc was not at all happy with this, and I was not at all happy when
it barfed.

- It steals all available memory. This may not sound like a problem,
but consider the following:

lharc p fred.lzh read.me | less

If the lharc process starts first, there's no memory left to create a
process for less. This is an _extremely_ rude thing for a program to
do, and even if it were the only problem with LHArc, it would probably
be enough for me to throw it out.

In short, I think Daniel's summary pretty much describes my stand:

> [...] When (and if) there's a ZIP- or LHArc-program for the
>Atari that correctly handles the Minix filesystem
[and is stable, I might add]
> you might be able
>to pursuade me into leaving ZOO, but until then...

I'm not holding my breath.

5469. Demo version of the EPSS sound system available.

Newsgroup: comp.sys.atari.st
Date: 1993-04-16 04:25:35 UTC
From: hasse@solace.hsh.se
Message-ID: <1993Apr16.052535.10528@solace.hsh.se>
Source record: 207548

Are you a musician?
Are you working with MultiMedia?
Or are you just interested in music?

Then EPSS is something for you!

EPSS is sample synthesizer that runs on any STe, MSTe, TT or Falcon with
at least 1MB of memory. (2 or 4MB of RAM recommended).
In standard configuration it plays 8 voices polyphonic at 25KHz using the
8 bit DMA-sound engine. A Falcon version is under work that will utilize
the Falcons sound engine.

EPSS can load midi-files and play them, or it can hook itself into
most of the common sequencers available, and be used as a synth.

Why not look it over yourself and find out what it can do!

It has been uploaded to atari.archive.umich.edu and ftp.uni-kl.de and is
called 'epssatom.zip'. The archive was packed using ST Zip 2.2.

If anyone got any question or problems, please e-mail me and I'll try to
solve them as best as I can.

Enjoy!

5472. Funky Floppy in a MEGA ST4!

Newsgroup: comp.sys.atari.st
Date: 1993-04-16 06:13:33 UTC
From: 01mbmccabe@leo.bsuvc.bsu.edu
Message-ID: <1993Apr16.011333.18154@bsu-ucs>
Source record: 207288
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I'm having a pretty severe problem croping up on my MEGA ST4.

I'm still in the process of "isolating" the problem, but am pretty sure it lies in the floppy drive.

I'm running off my HD with the floppy completely unhooked (it's sitting on the floor.:)...

When it was still hooked up and "running" I could be doing something (anything) on the computer and the system would appear to go into what I would describe as "reboot mode." Everything would stop and the system looked as if I hit the RESET button and kept hitting it about every second or 1/2 second. In between these "resets" the computer would attempt to re-access the floppy as it would normally do at boot-up time, but rather than reading the floppy woudl re-enter "rebott mode."

My first attempt at solution was to sharply smack the computer case directly ove where the floppy resides. This would temporarily allow the computer to continue with normal boot-up procedures, but would end shortly by having the system go back into "reboot mode."

My next atempt was to boot with no floppy in the floppy drive. This seemed to help, but after about 15 minutes something happened (I couldn't tell what) and the system again when into "reboot mode."

As I stated at the beginning, the floppy drive is now completely disconnected and is sitting on the floor. I've had the system up and running for about 30 minutes straight and still no "reboot mode." KNOCK ON WOOD!

Could anyone give me a positive ID to this problem?

Am I going to have to get inside the floppy drive and re-secure some loose chip , or is this indicitive of a trashed floppy drive? If so, then what sort of replacement drive is required?

Any help or comments (or condolences:) would be appreciated!

-Matt

Set the time-out in the Dialer-Dialog (C on the help-screen) to 99 seconds. You also have to look carefully for syntax-errors in your macro-file. Uniterm stops execution of a script without giving any warnings, if an error exists.

Hope it helps

5479. Looking for UUCP program for the ST

Newsgroup: comp.sys.atari.st
Date: 1993-04-16 12:03:27 UTC
From: mndell@cs.ruu.nl
Message-ID: <1993Apr16.120327.25061@cs.ruu.nl>
Source record: 207256

I'm looking for a UUCP program for the Atari ST to poll mail, news.
If there is anyone who has such a program or knows where I can find one,
please mail me.

Thanks in advance, Mike

5480. Scriba now works on ST/STE/TT/Falcon and new issue has been released

Newsgroup: comp.sys.atari.st
Date: 1993-04-16 12:53:43 UTC
From: ga@mrih.no
Message-ID: <1993Apr16.125343.9916@ugle.unit.no>
Source record: 207258

Scriba Communis Responsi now also works on the Falcon, and should work properly on monochrome, as well. Rerelease of volume 1 has been uploaded to ftp.uni-kl.de and atari.archive.umich.edu.

Volume 2 Issue 1 was released today, and is the fattest issue so far. Also uploaded to the above mentioned sites.

>>have extended and expanded memory sure, but no more than 640K primary. Yes?
>You Probably can't do more than a base of 640. The limitation is in DOS not
>the 386/486 architecture. As Stated the rest will probably be XMS and EMS
>memory.

Hmmm... I wouldn't be too sure about that.... assorted computers have
been able to run MS-DOS with more than 640K in the past. See a
discussion over in alt.folklore.computers over the past two weeks
about it..... examples include the DEC Rainbow and a few others.

Am I wrong or did PC-Ditto (I) give you more than 700K on a stock
1040ST for MS-DOS ??? I haven't run that in a while (It dies a
horrible death on my Mega 4/STE...) so I'm not sure if I remember
correctly.

5482. MGIF 4.1 uploaded: JPEG, preview, bugfixes...

Newsgroup: comp.sys.atari.st
Date: 1993-04-16 13:04:13 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <C5Kuz1.JIH@news.chalmers.se>
Source record: 207263

A new version of *the* monochrome GIF viewer, MGIF 4.1, has been uploaded to
atari.archive. It can be found in the Graphics directory as mgif41b.zoo.

This is a major update to MGIF.
The program is about twice as large and has a few major new features:

JPEG - Thanks to Frank Moehle, MGIF 4.1 reads JPEG (JFIF) files using
the Independent JPEG Group's software, version 4 10-Dec-92.
Copyright (C) 1992, Thomas G. Lane

Preview - Whenever a picture is displayed on screen it is first quickly
drawn using a half-tone algorithm before F-S dithering starts.
This means that you can see almost immediately what the picture
will look like and you can abort the F-S if you don't like it.

Convolutions
- For the first time in the history of MGIF, the convolution
functions now work! I never knew there was a problem until I
took a course in digital image processing a couple of months
ago. Apparently no one else knew either, since I never got any
complaints. :-)
The same fix has been applied to blur and median.

Buffers - The problem that caused MGIF 4.0 to exit on machines with less
than 4 (or was it 2.5?) Mb of memory is fixed.
You can now set the buffer sizes using command line switches.

Please, let me know if there are any problems, if you have any ideas for
future improvements etc.

The original author (v <= 3.7) of MGIF is Bill Rosenkranz.

>
>The next release of LHarc will handle Minix filesystem, doesn't steel
>al memory and is faster. Wait one or two month...

That obviously means Yet Another LHarc version that's somewhat
incompatible with the others;

Will this new version be fully compatible with archives created using
DOS/ Unix versions of LHarc? Or will PC developers build in some
different and incompatible new features there?

5484. MiNT 1.04 - Mine goes boom when ESC is pressed on Desktop

Newsgroup: comp.sys.atari.st
Date: 1993-04-16 13:52:51 UTC
From: sms@sys.uea.ac.uk
Message-ID: <sms.734968371@oxygen.sys.uea.ac.uk>
Source record: 207264

OK. I successfully got MiNT 1.04 compile a while back (about a month ago)
but after a little bit of use I discovered that it crashed when I pressed
ESC to update a window on the Desktop. Is this in fact a known bug or
have I done something wrong with compilation options.

Machine setup: TT030 with 4/4 memory, UK TOS 3.05

Software setup: Still crashes with nothing loaded but MiNT (I think)
Compiled with Lattice C 5.52 with memory protection disabled
and renamed to MINTNP.PRG

Anybody got any suggestions, words of wisdom etc. ?

BTW, I've been away for about 3 weeks so I apologise if this has already
come up.

Optimistic thanks in advance,
Steve.

5485. Re: Mac floppies under Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1993-04-16 15:06:01 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1993Apr16.150601.15376@newshost.lanl.gov>
Source record: 207268

Well, I'm NOT going to make any excuses for Dave Small's lack of visible support to his customer base. He's a big boy now and can handle his own.

I will take slight exception, however, to some of Mark van Wyk's comments. I for one, do not find the Spectre GCR "buggy" as he put it. No, it's not 100% error free (few pieces of software are!) but it's certainly stable enough to be a useable product suitable for daily use.

The majority of the problems concerning the GCR have to do with its ability (or inability) to read/write/format Mac floppies. Obviously, this is what makes the GCR special. Unfortunately, it seems that each Atari computer behaves differently and Atari's use of multiple vendors of floppy mechs doesn't help any. So it's largely a crapshoot if your drive will work with the GCR. Some do, some don't. Adding extra shielding sometimes helps but usually not. My point is that this is not due to the GCR but rather to design flaws and variances in the Atari hardware. The GCR that won't read Mac disks on your system probably will on your neighbor's. So "Caveat Emptor" seems to be good advice, here. Try before you buy if you can.

Mark did make a point I agree with, however. If you *really* need to use Mac software (not just for playing around) then you should consider buying a Macintosh. As good as the GCR is, it's an emulator after all. And a Mac Plus emulator at that. With falling Mac prices, you've got to consider the cost of the GCR+Roms vs the cost of an appropriate Mac. Depending on your need, you _might_ be better off with new hardware. You decide.

Yes, the current version of the GCR is outdated. It definitely needs System 7.0 support and support for Mac color Roms is needed too. But if he ever develops this "new" Spectre is mostly up to you. Will enough of you buy it to make it worth his while and expense? That's the $64 question, gang. With the market as it is right now, I wouldn't bet on it (IMHO).

Well, GER2EN21 bombs just after selecting the file. Try to run it in Medium Resolution (640x200 w/4colors). I've no plans to update the program, so you (or somebody else) will to write their own.

The program runs fine on ST, STEs (Not the MegaSTE) and TTs. So atari must have screwed up somewhere (The TT is 68030).

To spare the bandwidth, I have replied via email to Daniel Eriksson's post #67585 wherein he came to the defense of "phreaking", a hobby involving theft from the phone companies.

I publicly apologize for effectively stereotyping all "phreakers" as "pirates" as that was not my intent. Both groups steal the property of others and both groups frequently use the same justification, but being a member of one group does _not_ automatically indicate membership in the other.

If Pieter, Daniel or anyone else wishes to bring this back into public discussion at your expense, I'm prepared to defend my views against the promotion of criminal activities on the net. Otherwise, we'll keep it private.

At the time the Spectre came out, I'm not sure that you could even USE
a 1.4meg drive on the Atari, much less with the Spectre. Actually,
you can USE a 1.4meg drive, but *only* with the 800k disks (i.e. the
drive works, but not with 1.4meg MAC disks). Spectre seems to work
alright with my built-in 1.4meg drive on my MegaSTe (runs pretty
good at 16mhz as well)...

[misc other STuff deleted...]

>In fact, try going to a Mac dealer and purchasing

Little helpful info on Apple system software: versions of the System
prior to 7.0 CAN be copied (I haven't read the entire license yet).
Versions 7.0 (7.1?) and above are now charged for. Thus making
a copy of say System 6.0.5 is NOT piracy. There is even an apple FTP site
which has the system software available: bric-a-brac.apple.com.
I believe you're just limited in what you can do with the software
(i.e. where you can post it, etc) - limitations probably similar to
the latest releases of MiNT, etc... If I've goofed on anything
here, let me know (I'd hate to get on the bad side of an Apple legal rep :-)

>I know, I know -- he had family problems. Does this mean he just drops
>support to all of his paying customers?

If my son were severely ill, all my attention would be there, and not
with my job. At least those would be my priorities.

>What about hiring a secretary or
>something? I welcome any response to this posting.

I dunno how the company is run (i.e. how many employees, who they
are, etc). Maybe Dave just needs to develop a contingency plan for these
type of things. Having a backup support person would be a good idea,
however.

If you have a GEnie account, try logging in on Tuesday nights - there
is the Gadgets RTC (online conference) which

Dave Small has been dropping by lately. Probably the surest way of getting a message to him, anyways...

Of course, if you have problems with the GCR, use this network and other sources (GEnie, Compuserve, etc). There's usually at least someone who might have an idea of how to help...

True, the Intel market is huge, but given the tiny size of the original
NeXT user base, even the Atari market dwarfs it in comparison... But still,
there's tons more money to be made if NeXTSTep486 takes off.

Ah, but aren't you betting on the market too? I hope you don't have to feed many people on your Atari software sales.

As for the point you made the other day, about the number of potential Falcon buyers shrinking every day; count me among the losses.
I have had a fair-sized stack of money waiting since August, waiting for this thing. I went out and spent it last Saturday. (not on a computer)

No Falcon for me. No new software. No multisync. Not this year, anyway.

5499. Atari in Austin?

Newsgroup: comp.sys.atari.st
Date: 1993-04-16 19:12:18 UTC
From: mussack@austin.ibm.com
Message-ID: <C5LC0I.3DJw@austin.ibm.com>
Source record: 207276

I saw this group and got nostalgic so I pulled my old
520ST out of its box to set it up (for my kids 8-) but the
disk drive isn't working, the little light doesn't go on,
but I can here the motor whirring forever, and the computer
doesn't seem to recognize the drive. Anyways, where in Austin,Tx
can I get a single sided drive fixed, or maybe get a new one if
cost effective. Nothing is listed in the phone book.

By the way, what are good recommendations if I wanted to upgrade my
system. I have a plain 520ST bought in '85 with a color monitor
and a SS drive and 500k. I suppose hard drives and DS drives pretty
cheap, what about memory upgrades. What should I do if I only want
to spend $100, ($50)?

Gracias,
Chris Mussack

5500. Re: Mac floppies under Spectre GCR

Newsgroup: comp.sys.atari.st

Source record: 207278

The purpose of my negative comments about my experiences with Spectre GCR
and the "support" (or lack of it) I got from Gadgets by Small is to serve
as a warning to anyone who is contemplating buying an Atari computer with the
idea of having a useful Mac emulation. Five years ago, it may have made
sense, but nowadays it's foolish, for the reasons I outlined in my posting
last Wednesday. As for Spectre not working with all Atari disk drives ...
you can't really blame Atari if they have disk drives made by various
manufacturers that meet Atari specifications and tolerances and work with
Atari computers in Atari mode. But potential Spectre GCR customers, beware,
you can have problems. At this stage, Spectre GCR is only for those who
already own an Atari computer, or can get a used one at bargain basement prices
etc. The days that Spectre GCR was a serious, useful application are over, I'm
afraid. It was a very clever device, but passe' today. Sorry, Dave Small.

Well, I'm NOT going to make any excuses for Dave Small's lack of visible
support to his customer base. He's a big boy now and can handle his own.

I will take slight exception, however, to some of Mark van Wyk's comments.
I for one, do not find the Spectre GCR "buggy" as he put it. No, it's not
100% error free (few pieces of software are!) but it's certainly stable
enough to be a useable product suitable for daily use.

The majority of the problems concerning the GCR have to do with its ability
(or inability) to read/write/format Mac floppies. Obviously, this is what
makes the GCR special. Unfortunately, it seems that each Atari computer
behaves differently and Atari's use of multiple vendors of floppy mechs
doesn't help any. So it's largely a crapshoot if your drive will work with
the GCR. Some do, some don't. Adding extra shielding sometimes helps but
usually not. My point is that this is not due to the GCR but rather to
design flaws and variances in the Atari hardware. The GCR that won't read

Mac disks on your system probably will on your neighbor's. So "Caveat Emptor" seems to be good advice, here. Try before you buy if you can.

Mark did make a point I agree with, however. If you *really* need to use Mac software (not just for playing around) then you should consider buying a Macintosh. As good as the GCR is, it's an emulator after all. And a Mac Plus emulator at that. With falling Mac prices, you've got to consider the cost of the GCR+Roms vs the cost of an appropriate Mac. Depending on your need, you _might_ be better off with new hardware. You decide.

Yes, the current version of the GCR is outdated. It definitely needs System 7.0 support and support for Mac color Roms is needed too. But if he ever develops this "new" Spectre is mostly up to you. Will enough of you buy it to make it worth his while and expense? That's the $64 question, gang. With the market as it is right now, I wouldn't bet on it (IMHO).

>or made even a thinly veiled attempt to denounce telephone theft, then...

Yes, phreaking is illegal in USA and Canada. According to Pieter, it was NOT
at the time when he wrote his software in the Netherlands.
Why blast him for that? Are you going to go around saying Buffalo Bill or,
Davey Crocket should be sued because they didn't have a gun license??

Now, I agree his later rationalizations about the current situation are not
credible (Just like "Costs too much, so pirate"..)

Are you going to ask the police to come and charge my parents with speeding
because they went over 100 km/h in Germany on the Autobahn while on vacation?
I mean, it's clearly wrong here in NA NOW, so it MUST be wrong for all people
everywhere, at all times, right :-)

I mean, come on - if they show on TV how to do it, including phone company
employees talking about how to beat the system... Now, if you have some inside
evidence which shows he's lying, then, please state it..

Remember that ambitious Bell engineer who published the specs for the phone
system, including operator tones, etc?? :-)

Yes, but the keyword here is if NeXTSTep486 takes off. In other words,
isn't there also much more competition in the Intel market as far as OSes go
than the Atari market? (Not that I would want NeXTSTep, I buy a computer to
run applications, not to run an operating system)

Speed of Light version 3.0 supports the FPU for averaging and can average
a shrunken picture in about twice the time it takes to just "cut" out the
lines. It's pretty impressive compared to the normal CPU average! There
might also be some fractal programs that use it also..one that's TT specific.

>like it, and I'm sure you wouldn't like it if someone said: "If your
>name is John you must be braindead, 'coz so every John I know!".

There was a similar sort of discussion a month or two ago in
rec.games.video on the topic of those cartridge copying systems for the
Super Nintendo and Genesis. The pro-copier people claimed that they
were protecting their investment in expensive video games by backing up
their cartridges. Sounds great. But stop and think about it: How
many cartridges have you ever had fail? One? Two? I've played games
for over ten years and had two fail. How much does a copying system
cost? $400 or so. How many $50 games could you replace for that
$400? Hmmmm.

Phreaking is very similar. The legitimate reasons for doing so are
next to nil. If you want to phreak, I am absolutely NOT going to try
to convince you to stop. Maybe I'll make a quiet comment, but mostly
I'll put my money where my mouth is by not participating. What I can't
stand, though, is this silly "we're not really doing anything illegal"
front.

The same goes for software piracy (which has nothing to do with
phreaking, I realize). More than the actual copying and distribution
of ill-gotten software, I'm bothered by the "we're liberating the
consumers from the oppression of the Evil Software Companies"
attitude. There was a fellow in comp.sys.ibm.pc.games who claimed he
was pirating X-Wing because LucasArts' delivery schedule fell behind by
six months or so. Yeesh, at least take responsibility for your actions
and don't hide behind some imagined heroism. Hey, it would be okay if
I robbed a 7-11 as long as I give some of the money to charity...

I'm more mellow than I sound.

>do, in hardware) then the Falcon in text mode is still doing graphics! So
>you can be even more impressed by the Falcons ability to get the same amount
>of work done in text mode as a 386/25 (since the Falcon is really doing
>'graphics').

It never ceases to amaze me how folks on usenet find a way to make a
pedantic comment, no matter how precise you try to be in working things.

Let me try again, give you pendants more to work with:

When running applications that don't involve much screen output of any
sort, for example compilers and similar file-in/file-out work, the Falcon
is pretty comparable to the 386/25 system in terms of how much work gets
done in a given amount of time. This impresses me about the Falcon.

If we're talking about screen output of any sort, even "text mode" ASCII
output, then the 386/25 beats the Falcon by hundreds-to-one type ratios,
in direct proportion to how much output is being dealt with. The 386/25
can scroll text hundreds, of times faster than the Falcon. It can move
pixels around dozens of times faster. This depresses me about the Falcon.

To logon to atari.archive.umich.edu, you must ftp to the site.

i.e.

ftp atari.archive.umich.edu

login: anonymous (make sure you spell this right)
password: {your full e-mail address}

once you are in, you can use 'cd', and 'ls', to look around in the
directories. To download a file do this

ftp> binary

ftp> get {filename}

this will place the file in your current working unix directory.

Hope this helps!

I still think that "mild flamage" was called for. :-)

: Hmmm. Apparently the only thing more prevalent than pedants on usenet is
: folks who will happily flame a joke. I guess my new rule for plays on
: words has to be: if it would go over the head of a 6th-grader, avoid it,
: because someone will take it as serious and flame it.

Ok, I suppose I'm as stupid and immature as a 6th-grader. But Ian, please
tell me why I should take the following as a joke:

"I have to agree that ZOO is the lamest of the available archivers, and
should be shunned by all thinking people." and "Even with these problems,
it beats the heck out of ZOO, though."

I find it especially hard to enterpret as a joke when looking at the
other articles posted around the same time (where for example our own
Aussi-land-man (Roger :-) strongly argumented against the use of ZOO.

I'm really sorry to say that I find NOTHING funny about the two sentences.
But I guess if I had been more mature and had english as my native
language I would immediately have understood that it was a joke, or?

: I guess a secondary rule will have to be: even though the entire context
: of a piece makes it obvious you are stating a personal preference or
: opinion, you'd better put phrases such as "in my opinion" in every
: sentence, or someone will accuse you of trying to tell them how to think.

Let me put it this way:
You are a well-known personality in the Atari-community. We all know that
personalities have great impact on 'the masses'. If I'm the only one not
to understand your joke then this is of NO relevance. But if I'm not
alone (and I do hope I'm not :-) then we're looking at something that
might pursuade people not to use ZOO (just because that great personality
Ian thinks it should be shunned ;-). People that convert that way are
of course droids with no will, but they do exist - even in the Atari-
comunity.

I hope you understand my point of view.

Daniel Eriksson (m91der@tdb.uu.se, den@hgs.se)
(The immature 6th-grader who never understands a joke even if it laughs

him straight in the face, right Ian? ;-)

>Must I use telnet? or can I used rlogin?
>
>I have tryed telnet and the host asked for a login & password.
>I tryed anonymous, but that did not work.
>how do I get in?

Fred,
You sound like your completely new to the network so here's a few
helpful hints for you:

o using 'telnet' or 'rlogin' will not enable you to "fetch" files
from an archive, it is merely a means for interactive login. To
fetch files from an archive to must establish a non-interactive
session to the host machine eg 'ftp' "File Transfer Protocol".
you can do this by simply entering the command:

ftp atari.archive.umich.edu

you should now be able to login with 'anonymous' as the username
and your own 'username@domain' as the password ie if it was me
it would be:

username: anonymous
password: etlgtme@etlxd20.ericsson.se

This should get you in. You can now do commands 'ls' & 'cd'
to navigate yourself around the archive. To fetch a file you
must type 'bin' or 'image' then type 'get <filename>'.

o Alternatively, you can use the Mail server (BART).
Send an E-Mail message to:

atari@atari.archive.umich.edu

Make the 'Subject:' field whatever you like but in the body
of the message type 'help' and the server will send you back
an E-Mail message about how to request files via this method.

Personally, I have NO ftp access to atari.archive.umich.edu so
I have to use the BART mail server which works very well,
most of the time, many thanks to Jeff Weiner,

Good Luck,
Grant.

I've had this happen before with an intermittent power supply connection.
Perhaps your power supply is dying. The explanation is simple - it takes more
current to actually operate the floppy drive, so when the system tries to draw
more power and the supply can't handle it, total system voltage drops, causing
a reboot, and on and on...

There are plenty of other bugs
too numerous to mention here, but just in case anyone out there plans to buy an Atari with the idea that you can have a flawless Mac emulation, think again. You will most certainly have problems, and by my experience, no support from Dave Small of Gadgets by Small.

I use the GCR constantly. Every application has run flawlessly. The only application that I had to get help on was the ThinkC debugger. Some kind sole posted a 2 byte patch to the net some time ago. It seems it was touching the hardware in some way looking for the floating point unit.

Framemaker runs quite well, even on a 8 (now a 16) Mhz machine. (really quite interesting given how fast Frame apparently runs on my Sparc 1+) ThinkC works perfectly. Virex and Disinfectant run. Norton utilities work, including the defragger. The list goes on and on.

The fact that only system 6.0.5 runs is for many people just as well on a four meg machine. I can keep my system under 700K and get a pretty usable machine on four megs of memory. System 7 is nice, but the price in performance and memory use is high for the features it gives. Reminds me of modern versions of Unix....

Spectre GCR is an excellent way to get a Mac for a person with an Atari computer. Given the current price of an LCIII, I probably wouldn't recommend a new Atari with a Mac emulator unless you actually want the Atari (better wait for Falcon support from Dave & company then).
Of course why wouldn't you buy just the Atari computer anyway :-)

Howard! You are a _smart_ guy as proven by many informative posts, but
come on, the ATARI market dwarfs it? How can you compare a 68000
(before anyone flames... I said 68000 not 680x0) based
computer with the NeXT? I am one of a few TT owners in the U.S. and I have
seen numbers of over 50,000 NeXT computers sold... Granted that is nothing
compared to IBM compatibles but come on now... qualify your statements a
little better. NeXTSTEP running on a MegaSTE ::guffaw:: yah right!

Could you please explain how you could get 100:1 ratings??? Especially since
a 386/25 don't have that kind of performance.

Btw, didn't you know that the Falcon has hardware scrolling? And it's faster
than any normal 386/25 ever is going to be....

Just tell me *any* graphic application that runs faster on a normal 386/25
than a Falcon.

Not to belabour the point or anything, but NOT THE "EC"! As someone else
also pointed out, the EC has no MMU (possibly other things, don't know),
it's the 68LC040 that has a disabled FPU. That's LC!

All right, I'll come to Dave's defense (forgive me if someone alreadey has,
but I haven't been on in a couple days....)

In article L676791@LMSC5.IS.LMSC.LOCKHEED.COM, L676791@LMSC5.IS.LMSC.LOCKHEED.COM ()
writes:
> Don't feel bad, you are not the only one who has problems with Spectre GCR.
> Spectre has plenty of bugs, and difficulty in reading Mac disks from time to
> time is one of them. One thing you might try is to format a disk in Mac format
> while still in the Atari mode (single sided seems to work, and it's quicker).
> Then go into the Mac part of Spectre GCR, and usually the problems with reading
> Mac disks go away. If Spectre GCR causes a grinding noise on one of your
> floppy drives, don't despair, you are not alone. This is common. It hasn't

You might also make sure you boot up with a disk in your drive. On my TT, Spectre
won't touch a disk if I don't do this. And light-off programs don't cut it.

> hurt anything yet, but it sure sounds nasty. There are plenty of other bugs
> too numerous to mention here, but just in case anyone out there plans to buy
> an Atari with the idea that you can have a flawless Mac emulation, think again.
> You will most certainly have problems, and by my experience, no support from

> support his customers. Yes, Dave Small apologists, I know you are out there,
> ready to jump to his defense and flame me for denegrating your hero, but the
> fact is that Spectre GCR is hopelessly outdated (it only runs system 6.5 or

What's wrong with 6.0.5 (and by the way, it DOES run through 6.0.8)? I've
used System 7, and can't stand it. It cut's the computer's speed by at least
half. "But I like multitasking." But who needs it on a Mac? I'd bet you
at least 90% of Mac time is spend with a word processor, or maybe a drawing
program or a spreadsheet. Multitaskings a big help there. And what about
virtual memory. Well, if you ditch System 7, you'll free up 2 megs and you
won't need virtual memory.

Oh, and do you know about the new Mac emulator that runs on Sun Sparcs?
It emulates a Classic (not a II) in monochrome only running ONLY 6.0.7.
And I would guess its price would make Spectre look quite affordable.
(I've been trying to install the demo version here for the past day--
without sucess. It doesn't tell the price.)

> below) comes with a poorly written, incomprehensible manual, and doesn't

What???? It has got to be the best software manual ever written. Most manuals
make you want to throw them away and just hack at it. Dave's is quite
entertaining.

> have the basic facts necessary, such as the fact that a 1.44 meg drive won't
> work with Spectre GCR. So, if those of you out there are considering buying

Well, being as the latest version was released before anyone had 1.44 meg drives
might be an explanation.

> an Atari which will become a Mac with Spectre GCR, take my advice. BUY A
> MAC INSTEAD! If you already own an Atari, and find you need a Mac at home for

Well, I did what you say not to, and I haven't been too dissapointed. I had
trouble with the Atari dealer much more than with Spectre. Yeah, a real Mac
might run smoother than Spectre, but then you've only got a Mac. Big deal.
Ever try to program on a Mac? Forget it. You can't shake the lousy desktop.
And how often do you have to eject the floppy with a paper clip? I personally
prefer a button.

> your work, Spectre GCR can be somewhat helpful. For example, you can install
> an OLD version of Microsoft Word (like 3.2 or 4.0), and write text at home, and
> bring it into work on disk, and if you have Microsoft Word 5.0 or 5.1 at work,

> or 5.1 files with Microsoft Word 3.2 or 4.0, so you can't take stuff done on
> the latest version of Mac Software and make it work on an older version. Only

This would seem to be Microsoft's problem (excuse me, but I don't appreciate
them trying to take over the world). If they weren't so high on themselves,
they'd make their programs backward compatible. (And by the way, I prefer
Word 4.0 over 5.0 anyway.)

> vice versa. And here's the kicker. Spectre GCR is by now so ancient, it will
> only accept OLD versions of software like MS Word or Aldus Pagemaker. Try
> finding those anywhere. In fact, try going to a Mac dealer and purchasing
> sytem 6.5 or 6.4 system/finder. YOU CAN'T! They don't sell them anymore. So

That's right! It's free! You can take some empty floppies into a dealer and
they'll give you a free copy! (Yes, I have done this.) Or, if you don't want
to go to that much trouble, you can just download them off the net (from
ftp.apple.com /software/mac/sys.soft).

> in essence you must be a pirate by necessity. If anyone cares to jump to Dave
> Small's defense, be my guest. He never once got back to me or the dealer who

> ----Mark van Wyk
> (408) 739-0541

I'm not saying I've had no problems with Spectre, but they've been solved for
the most part and I'm quite satisfied with the product.

Hi Dan, thanks for the info, but a couple of problems.. Firstly, I don't have a Unix system, I'm on an Atari 1040ST.. Also, as for my address here, I really don't know it, I'm new to the whole USE/Internet thing, and don't really know how to use it yet, which is why I am responding to you in here, as I can't get the mail in Internet to work correctly. How would I go about getting my address, and how do I turn the message into a file on an ST?

This brings to mind a question I had.

Does the existence of the Falcon mean that no more demos for the ST's
will ever be made (by the 'major' groups, at least)? I assume it does,
too bad...

Later,
Steven Ourada

Of course the Atari market dwarfs the NeXT market! Sure, the NeXT is more
sophisticated but it seems that nobody really bought 'em. I'm using a
NeXT right now and people joke that our college has all of them. 8)

So HOW do you plug it in? From what I've heard, neither the "Processor Direct" (aka MegaBus) Slot nor the FPU socket could be used for such a thing... RAM access through the PDS is slower than through the 16Mhz '030, so an accelarator would run _slower_ whenever it had to go out of its cache space... Do you have to clip out the CPU (bloody surface mounts...) or what?

It'd sure be nice if it was true (and not incredibly expensive, like I imagine it will be). An '040 board would be even nicer (I need an FPU of some sort; too much raytracing...).

Its a bug in tosfs.c in the function tos_dskcnhg() I posted Eric diffs
some time back but I know life's been somewhat busy for him! You need to
add a check for the directory handle bit and skip the throw away active
file handles loop (there's a number stored in a pointer which gets used).

If you can't suss it mail me and I'll grab the sources from the office.

5527. ST/TT with Multisync Monitor

Newsgroup: comp.sys.atari.st
Date: 1993-04-17 15:27:10 UTC
From: ca2ee209@troi.cc.rochester.edu
Message-ID: <1993Apr17.152710.13351@galileo.cc.rochester.edu>
Source record: 207407

I posted this in the tech group but get no reply.
Here is it again.

I would like to know what model of Panasonic Multisync monitor
works with ST/TT and what kind of swtich box do I need to get.
In general, what do I need to know about the monitor?
I have also heard that there is a monocrome model of the NEC 3D.
Does it works with the ST/TT? If so, can anyone tell me where
I can possibly get it since I never seen it advertised.
Also, does a TT need a swtich box/adapter to be used with a
multysync or VGA monitor?
Thanks in advance

The colours might not be wrong... they're seriously brain-damaged on my
ST. In fact, the colour choice is so bad, the menus are almost
impossible to read... Nice black text on a dark grey background.

What amazes me is the fact the people can stay VERY enthusiastic (to the point of flaming anyone that says anything bad about Atari or the Falcon030) for a vaporware product that is taking a YEAR to come to market.

HOW can anyone possibly stay excited about a 16Mhz '030 system that is this late?

>Let's drop this now and get back to more important Atari-related issues, OK?

>Thanks,

>John.

Hi John,

I'm glad you settled and ended this totally unnecessary thread -
it wasn't half as interesting as the many I've seen. Bravo !

Nevertheless, since I unvoluntarily initiated it here's some notes
on the side I just had to make:

* First of all, I sign my postings with RowdyB, because basically,
it matches 'Rowdy Blokland' best - the name my daft parents made up
in panic when I entered my current incarnation - please don't
mix it up with my dear friend Pieter :).

* Indeed, phreaking is since 1.5 month IL-legal in the Netherlands.
You are totally correct when saying my notions w.r.t. the relative
harmlessness of phreaking are NO defense at all - the judge would
yawn till his/her ears bleed.
It DOES indicate that 'billing decent users for the damage done'
and that sort of things is laughable NONsense; uttered time and time
again by the technologically ignorant. Phreaking via tollfree numbers
effectively causes zero-damage (mail me anytime for a thorough dis-
cussion) and simply CAN NOT affect decent citizens OR the telecom's
profits. Keywords as "moral", "the rights & property of others",
"being sad" etcetera are therefore misplaced and theatrical boohoohoo.

* Piracy, on the other hand, is indeed a serious problem. No matter
what the justification, this activity DOES cause (major!) damage,
and one need not be an Atari software developer to be worried about
it - but I understand it helps. Though both phreaking and piracy
start with a 'p', I'm glad you FInally gave up linking these two :).
(On the side; I know several Atari software developers who are/were
into phreaking. It combines effortlessly.)

* Although programming and spreading a dialer isn't the most optimal
solution to put an end to phreaking, I never "promoted" phreaking
anywhere ! In addition, the user manual that comes with it contains
NO phreak-info whatsoever, yet purely describes the variety of

functions it is so delightly larded with. The disclaimer even advices against the (illegal) use of it. I merely seek to spread my 100% legal baby via a number of ways, which is why I posted to begin with !

A fine start will be the adoption of it in the PD-library of the Dutch ACN (Atari ST) magazine (circulation: 22,000 a month) at the end of April, with possibly a hooked up article as well.

Thus ending the thread,
Enjoy!
RowdyB

5531. A boring non-question: Can I get the FAQ?

Isn't that about what a Falcon030 4/65 is supposed to cost, roughly?
And its faster and can take more RAM (not to mention SIMMs instead of
extra-expensive proprietary RAM expansions)...

I hate to burst your bubble, but... There's _no_way_ the Falcon030
street price could _possibly_ be much less than the suggested retail
price, unlike the Macs. After all, even if Atari dealers could get the
machines, they couldn't sell enough to allow them to cut their per
machine margins.

Youl'll see one again the 1st of May. Sorry I didn't get one posted this month.

In the meantime, you can get a copy of the last one from the news.answers archive at pit-manager.mit.edu:/pub/usenet/news.answers/csas-faq, parts 1, 2 and 3. I believe there is also a copy at atari.archive, but last time I checked, it was older than the newest copy...

Later,

I used to use Flight Simulator II from subLogic on an Atari Mega 2. Now, I have Microsoft Flight Simulator 4 on a '386 notebook (I run MSDOS rather than Linux only when I am using Flight Simulator). For the Atari Flight Simulator, I had the additional European scenery disk. I have copied the only file on the disk (named F8) to an IBM-format floppy and played with it a bit, but have not found a way to get it to work with FS4. Has anyone else tried moving scenery disks across platforms and had any luck? Is this hopeless?

Thanks for any help,

David

5537. First look at the Falcon...

Newsgroup: comp.sys.atari.st
Date: 1993-04-17 18:24:21 UTC
From: mmartin@neumann.une.edu.au
Message-ID: <mmartin.735071061@neumann.une.edu.au>
Source record: 207414

I managed (finally) to get hold of a Falcon a couple of days ago and I thought I would post my first impressions for the benefit of anybody who may be interested (judging by the ammount of traffic/debate/abuse that has occurred on this subject recently there may be more than a few people interested). Overall I am very pleased with it, but that may not be surprising since I have been using a 1meg 1040 with TOS 1.0 for the past 7 years with occassional bouts on Megas and STE's. As far as I can tell, number crunching is 2 - 3 times faster than the 1040 and hard disk operations appear to be very quick (I reserving judgement on this for the moment but as a guide a 1060k text file takes 5 seconds to load into Pure C).

Here is the specs of the Falcon 030 and a list of the software I got with it:

- 4megs RAM/65 meg HD
- TOS V4.01 dated 2/10/92.
- standard Atari mouse (yuk).
- ST:Falcon video adapter.
- VGA:Falcon video adapter.

[The last 2 items were rumoured to be worth AUS$59 a throw but I paid no extra for them].

- owners manual for the Falcon [a big improvement over ST manuals but still not comprehensive enough IMHO]
- it cost me AUS$1950.00

The hard drive came pre-formatted and partioned and contained the following:

- hard drive utilities
- hdx.prg
- ahdi.prg
- hinstall.prg
- games
- breakout
- landmines
- calappt (calender/appointment thingy, there was a manual for this)
- procalc (scientific calculator that handles binary/hex/octal etc)
- d2d (direct-to-disk recorder - I've had some problems with this, namely large ammounts of distortion in some signals that appeared fine when they were

actually being recorded. The manual for the falcon does not talk specifically about the impedence of the mic/headphones ports [stupid mini-stereo things] and my mixer doesn't like being plugged into the mic port no matter what settings I use in the Falcon. The recording level display/meter in d2d seems to be out of whack in this version at least).
- Works (word-processor/database/spreadsheet prog. I'm using the wp to type this and it is easilly the best I have used on an Atari - the auto formatting is great. There is no dictionary/thesaurus tho.. supposed to be sent to me when available. I haven't looked at the other parts of Works yet but if the wp is anything to go by then I'll be happy (again)). When I imported a document that was created using 1st Word Plus, Works did not recognize spaces in the file (strange) so I replaced all the spaces in the original doc with '#' and replaced them with spaces in Works... a bit of a drag but you only have to do it once.
- tlkclock (a f%*&$** talking clock)
-1 disk marked 'Falcon 030 Language Disk (English-UK) Rev E' containing hd utilities mentioned above as well as CPX files and a graphics demo called lines.prg - not exactly spectacular on my SM146 monitor.
- 1 disk marked 'Falcon 030 Extra Programs (U.S.A) Rev D' containing nothing I haven't already mentioned.
- 4 disks supplied by the dealer containing speedo GDOS, afm9beta (Audio Fun Machine - haven't looked at this yet - it doesn't sample), SAM (System Audio Manager .. DA that links system calls to audio samples as well as sampling from the mic input. This sampler works well - no distortion here) and other stuff I've already mentioned.

None of the programs include either printed or disk manuals apart from calappt so it's a matter of try it and see what happens. The dealer sez manuals will follow as soon as he gets them. That's no big deal as far as I'm concerned - I'd rather have the software without manuals than no software at all, especially when it's as good as Works. There is, of course, one glaring ommission from the above list - no MultiTOS... I'm told that's due within the next week or so (haven't I heard that somewhere before?).

The desktop has been revised and is much better to work with (for example you can assign a keystroke to any menu option and assigning different icons to different file types etc). I don't have the time to go into alot of detail here but generally it's a big improvement over previous versions of the desktop.

The keyboard is also alot better than my 1040 (exactly the same layout but white lettering on dark grey keys) but I wish it was detatchable, I'm really sick of having to move the whole machine depending on what I'm using it for.

Over the past few days I've tried most of the software I commonly use on the 1040 and the vast majority of it works (and if it works it works alot better on the falcon). Here's a(nother) list:

- Pure C and Pure Debugger [V Nov 12 1991]: well the performance of these programs are almost worth the price of admission as far as I'm concerned. This is a great programming environment .. fast compilation/linking, the (wonderful) debugger runs fast and flawlessly from the Pure C shell, file i/o is positively blistering and the whole set up seems very stable (I did manage to lock it up once after several bus errors in the program I was debugging due to some deliberate errors I put into the code to see what it would take to make it fall over - it took an awfull lot before it did and then it was only when I exited Pure C to go back to the desktop. I was still able to save prior to this so nothing was lost).

- RCS [V 1.4]: no problem.

- ORCS [V 1.0]: no problem. This is a great program, you can learn alot about GEM resource structures (if that's what turns you on) from just fooling around with it.

- 1st Word Plus [V 3.14(UK)]: works fine but I won't be using it again after Works.

- Word Writer [V2.0]: works fine. An occassional bug occurrs if you click above or below a window slider (paging) - there are 2 messages if the mouse button is held slightly too long so the doc jumps 2 pages instead of 1. This maybe caused by the mouse settings - I haven't checked this yet.

- Rufus [V 1.06]: no problem - very nice in fact.

- Rufus [V 1.11 release 9]: fragile - fell over twice in 5 minutes last night. Could just be the set up though.

- Arcgsh [V 4.1]: Reiner Klutes' archiver shell - no problem. Very quick on extractions.

- Fcopy3 [V 5/2/90]: no problem - very fast (is this getting monotonous?).

- Dcformat [V 3.0]: no problem.

- Little Green Selector [V 1.8c]: no problem.

- Desk Manager 3.3: no problem.

- C-lab Creator [V3.1]: no go - locks up during load, due (I'm told) to changes to the cartridge port so Creator doesn't recognize that the key is in.
- C-lab Explorer32 [v 2.0]: no go - locks up during load.
A pity about this. As a result I'll be hanging on to the 1040 untill Emagic release Notator Logic and an equivilent synth editor. I'd be interested in hearing from anybody who has info on this. One of the main reasons for me getting a falcon is the potential for using the DSP in parallel with a sequencer and to find that one of the main sequencing priograms available for the ST is useless on a Falcon is a big drag. At this stage I have no idea of the cost of upgrading to Notator Logic but I'll bet it won't be cheap. I hope that Emagic will provide some half-way option for users who want to continue to use Notator/Creator and combine these great programs the Falcon (Notator Logic is fundamentally different from Notator on the ST). I'm also told hell may freeze over soon ... ho hum.

I make no apologies whatsoever for buying a Falcon - for me it still made sense even without Creator. I'm involved in developing a program that is screaming for the DSP capabiltities of the Falcon - all other options involved completely dumping my existing software/programming work and alot of time converting compositions to a new program and platform. Also, I actually like Atari computers (GASP!) if not the behaviour of the company.

On the off-chance that somebody else may like to get a Falcon, the name of the dealer here is MultiLearn in Sydney (I can't say if they will have any in stock though). I am grateful for their help with the whole thing and I can recommend them highly. Thanks also to Mike (miff) Smith who pointed me in the right direction in the first place.

If anybody wants more info on anything I've said here, then I'll do what I can to help.

Mark.

To put a fine point on things, I believe that this is bullshit. I can understand the 386/25 being possibly 5 times faster than the Falcon. No way is it a hundred times faster. If I'm totally wrong, please demonstrate why I am wrong and I'll be happy to eat crow.

> just tell me *any* graphic application that runs faster on a normal
> 386/25 than a Falcon.

I have no idea what you mean by "normal". I suspect it's an attempt on
your part to pre-hedge against any answer I might give.

The answer, by the way, is simple: Cyber Paint and Autodesk Animator Pro.

Cyber Paint is a 16-color animation program that runs only in 320x200
mode. Autodesk Animator Pro is a 256-color animation program that runs in
any resolution on MSDOS machines. Ani Pro grew out of the Cyber Paint
source code, so it makes a uniquely valid comparison.

The 386/25 machine can play 256-color 640x480 animations faster than the
Falcon can play a similar (in terms of deltas) 16-color 320x200 animation.

When I tried to port Ani Pro playback to the Falcon, so that I could do a
truly direct comparison between the two machines using the exact same
animation file, I couldn't get any better than 3 frames per second on the
Falcon for an animation that will play at 30 fps or better on the 386/25.
(And I have been a 680x0 assembler programmer much longer than I've been a
80386 assembler programmer, so I don't think quality-of-implementation had
as much to do with it as you might think. The problem, quite simply, is
the Falcon's brain-dead interleaved bit plane scheme for storing pixels in
256-color mode. If the Falcon supported byte-a-pixel (aka packed-pixel)
video memory layout, I have no doubt it would run circles around the
386/25 machine.)

> You are a well-known personality in the Atari community.

No, not at all. I am, perhaps, a well-known name in the community, although I consider that to be debatable. Y'all are just barely getting to know my personality. I think many don't like it. Tough.

I'm opinionated. I play games with words a lot. I love arguing just for the sake of arguing, long after the main point has become moot. I'm brash and obnoxious. I am, when it comes right down to it, pretty misanthropic.

On the plus side, I know a lot about computers, mainframes and Atari especially, and I don't mind sharing what I know. I also think it's a fun thing to create software and give it away for free.

Y'all will have to decide for yourselves whether you think the pluses and minuses balance out. But whatever decision you reach, keep it to yourself, I don't really care.

>I would like to know what model of Panasonic Multisync monitor
>works with ST/TT and what kind of swtich box do I need to get.

Dunno about the Panasonic models, but I believe one of the "switch boxes"
that will let you use your ST with a multisync is called "Omniswitch"
(this actually lets you use a VGA/multisync, and also lets you have
an additional disk drive port as well. You plug the Atari monitor cable
into one port, and plus your multisync/VGA (15-pin) cable into another
port on it...

>In general, what do I need to know about the monitor?

I think it has to be capable of a certain scan rate or frequency
(15khz comes to mind, but don't take this as the actual number - someone
else here probably knows the correct specs)...

Hope this helps...

5548. AMON for Devpac 3 question

Newsgroup: comp.sys.atari.st
Date: 1993-04-18 01:58:42 UTC
From: ppospis@mtroyal.ab.ca
Message-ID: <1993Apr17.195842.3379@mtroyal.ab.ca>
Source record: 207427

I am trying to run the AUTO MON (AMON) for Devpac 3, but can't get it
to install correctly, on either a 1040 ST or STE. On the ST it dislikes
any program being before it in the AUTO folder, which is a problem since
I use poolfix and pinhead which need to go first.

On the STE the same holds true with STEfix.

Any suggestions?

Paul

JH> here. Try before you buy if you can.

Doing GCR at all can be considered a minor miracle. Especially since the floppy routines in the old Mac Plus ROMs (which Spectre uses) depend heavily on timing, and these are based on the 8 MHz 68000 in the Plus. Doing GCR on faster machines has proved a problem for Spectre, and I am doubtful if it can be made to properly on a consistent basis non-68000 machines. Mac Plus accelerators have this problem too; I don't know what the workaround is, however.

YHS:QSI!

5550. Re: Archivers which can cope with directories

according to Webster's:

ar-chive n., 1. a place where documents and other materials of public
or historical importance are preserved.

in the world of computing, archives have a similar meaning. only *most*
people i know of want to be able to access the archive data in (at least)
two important ways: 1) from other currently accessible systems, and 2) far
into the future.

a true "thinking person" will immediately *require* the minimum attributes
of an archiver:

1) portable source code (so porting can be accomplished). i don't
know about u, but i doubt i'll have an atari in 10 years, but
i'll still want to get at my data.
2) identical behavior on all platforms to which the archiver can be
ported. this includes version control (version x on platform
abc should work the same on platform xyz). this implies that one
person or group controls it (eg POSIX for tar, rahul dhesi for zoo,
SEA for arc, etc).
3) must make the aggregate archived data smaller in size than the
original data. how much is of relatively little importance since
today everything available is within 50% of each other.

1) is reasonably satisfied by code written in ANSI C (that's why we have the
standard in the first place). i won't even think about C's future replacement
as a language (it is supported on most systems available today and will
likely be supported for at least 10-15 years).

beyond these, everything else is convenience and to some extent fluff. this
includes packing density (convenience), speed (convenience), GUI (fluff),
directory support (convenience), support for tiny systems, eg floppy-only,
small memory from 5 years ago (convenience), etc.

based on this, i would offer the following evaluation:

zoo 2.1 source freely available, 100% ANSI C, supported by
many platforms (TOS, MS-DOS, unix, VMS, etc), stable,
controlled.
lharc of the myriad variants, the lha 1.00 code is good
enough and competetive with zoo 2.1 (note that this
does NOT include the so-called "Questor" lharc which
is written in 68k assembler). i have had good luck
(so far) with lha. still a "moving target" but better
than it was 6 months ago.

tar source freely available (GNU), 100% ANSI C. needs a
compression program to either compress the individual
files (bad) or the entire archive (good, but has
naming problems with 8+3 systems)
compress very stable, source freely available, has been the
standard for unix. only compresses single files.
GNU zip the GNU replacement for compress, source freely
available. only compresses a single file (ie is not
really an "archiver").
zip many (incompatible) versions (i have recently posted
ST .zip files i can't unpack with unix unzip, though
all MS-DOS .zip files i have found can be unpacked
with unzip)
arc 5.21 super stable, limited features (no directories), "old"
performance (huffman), source freely available
arc 6.02 no source (hence unacceptable) but does solve the
lack of directories

right now, i'd say my personal choices for "universal" archives would be (in
order): zoo 2.1, arc 5.21, tar/compress, lha 1.00, tar/GNUzip.

i put arc high in my list since about half the stuff i have on long term
storage (floppies from 5 years ago) is still .arc files and because the
general trend is for storage space gets cheaper/larger computers get faster.
i would consider lha 1.00 as a 1:1 equal with zoo except that i think it is
far less stable (which i define as too many new formats too quickly - ie it
is not managed well). i mostly use tar/compress for source code trees (ST and
unix). i am debating what impact GNU zip will have. the fact that they picked
.z as their suffix (which, on file systems like TOS which are case independent,
conflict with compress's .Z) makes it ambiguous (it also conflicts with
system V unix's pack(1) command which uses .z).

flame away (roger, ian), but think first...

] The answer, by the way, is simple: Cyber Paint and Autodesk Animator Pro.

Are they both compiled with the same optimisation levels etc.!?

Newer programs usually have tidied codes, and Cyber-Paint was hardly
intended as a multi-system program!

Compare things such as True-Paint and something similar on the PC, they
are recent, and are made to be multi-resolution etc.

Comparisons are pretty daft any-way, no two programs will be the same
speed, even if both machines are 16Mhz, running in 640*480*256 mode!

Different architecture, and different programming produces different
program, 'benefits'.

ST-Action gave it just on about 90%. Looks pretty similar to Ultima 5.

If you like that, get Amber-Star (or better yet, Amber-Moon), that got rated even higher, and sure looks a lot nicer! (Amber-moon will apparently be ported to the Falcon, which would be good!)

Or, if you really like Dungeon-Master3D-type games instead, check out Legends of Valour for the Falcon, full3 dimensional smooth-scroll graphics, with high-quality bitmapped graphics, morphing etc. Screen shots look *very* impressive!

NeXTStep cannot be that bad as windows is. I just don't believe that
it has any changes to run over microshit, there is too many people
who wants to believe that windows is best what they can get _before_
they have looked any other operating system.

And when I buy computer, I look first which kind of hardware it has
and after that which kind of applications I can run on it. If I'm not
happy with both, I choose other platform.

[...]

However, since GNU zip does support decompression of both COMPRESSed
and PACKed files there shouldn't be much of a problem. The only problem
I see is if the downloaders of your program don't use gzip. Since FSF
have changed from compress to gzip in the GNU-project, I think we all
should try to throw those old compress-programs out the door.

For those who haven't noticed it yet, GNU zip supports the Atari-line of
computers directly in the sourcecode nowadays. The latest version can
always be downloaded from your local GNU-supplier, or if they haven't got
it, from prep.ai.mit.edu by anonymous FTP. If you don't have the resources
to compile it yourself the executable files have been (and will be) uploaded
to atari.archive.umich.edu, ftp.uni-kl.de and ftp.cs.tu-berlin.de.

At the moment gzip does not handle both long multiple-dot filenames and
normal 8+3 filenames in the same executable. This should change in the
near future. In the meantime there's two different programs to fill
all needs. One that correctly follows the 8+3 rule, and one that happily
adds a .z suffix to whatever filename you feed it (works great under a
Minix filesystem :-).

Happy packing!

Anyone know if this program uses the DSP. It should be possible do uncompress jpegs pretty quick on the DSP but this program is quite slow..

This is total shit!! I have a Falcon and it's at least as quick as a 25MHz
386! The hardware of the Falcon is generally quite excellent.

There hasn't been a chance for anyone to code on the Falcon properly yet.
When they do you'll see it's generally a much superior machine.

>1040ST for MS-DOS ??? I haven't run that in a while (It dies a
>horrible death on my Mega 4/STE...) so I'm not sure if I remember
>correctly.

There are two different problems:

First, DOS runs in real mode. x86 running in real mode cannot use more than 16 segments with more than 64kB each, (16 segments with 16 Bit addresses). This is for compatibility to older, pre 286 processors. This is a software problem, or, even worse, an OS problem.

Software using protected mode lives in a 32 Bit linear address space equal to MC680x0. UNIX, OS/2 and Windows NoTechnology do so. i386 and higher even have a builtin MMU (genuine, with address translation and memory protection, but fixed page lenght) as Motorolas with 68030 and higher.

Second, IBM decided to use the top part of the enormous 20 Bit address space for extension cards. So the last six segments are reserved for video, serial, parallel, etc. adapters. This is a Hardware Problem.

There are a lot of workarounds, which use memory exceeding this 20 Bit address space for various purposes. Ramdisks, device drivers etc. can use this area to keep as much of the 640kB workspace available as possible. Data in this memory

can only be accessed through an 8kB address window in the adapter area.

cu

5569. Re: ST/TT with Multisync Monitor

Newsgroup: comp.sys.atari.st
Date: 1993-04-18 13:52:35 UTC
From: gutschk@uni-muenster.de
Message-ID: <1qrmf3$22jn@obelix.uni-muenster.de>
Source record: 207445

ca2ee209@troi.cc.rochester.edu (Ho Ling Cherd) writes:

>I would like to know what model of Panasonic Multisync monitor
>works with ST/TT and what kind of swtich box do I need to get.

I do not know about Panasonic monitors, but generally speaking most MultiSyncs should work with your computer. As far as I know, any VGA will work with the TT. The TT will not require a switch box, though it might require an adaptor (I am not sure about that...); the ST will definitly need a switchbox if you want to display both color and monchrome modes. The pinout is pretty obvious, so if you cannot buy one, building it yourself is quite easy.

BTW, you will not be able to display TT High on your monitor, this requires either a special monitor or some kind of special switch box.

>In general, what do I need to know about the monitor?

If you want to connect the monitor to your TT, just get any VGA monitor, though SVGA and/or MultiSync capabilities are strongly suggested if you plan on using it at any other computer you might be buying in the future. For instace, I am currently running my Falcon with an SVGA MultiSync, which allows me to display 800x608 pixels (this is some (dirty) hack with the video regs :-)).

If you want to use the monitor on an ST, you will have to read the spec's more carefully. For monochrome mode, the monitor should allow a vertical frequency of up to at least 72Hz, though the horizontal frequency of about 30kHz can probably be handled by about every monitor. For color modes, the vertical frequency is either 50Hz or 60Hz; most monitors will be able to display this, but they might be having problems with the horizontal frequency of just 15kHz --- actually I do not know any monitor, that is still able to display such a low horizontal frequency. Anyways, for the ST I would really advice you to get a MultiSync monitor, for the timing in monochrome is kind of non-standard, which might cause problems with non-MultiSync monitors.

>I have also heard that there is a monocrome model of the NEC 3D.
>Does it works with the ST/TT? If so, can anyone tell me where
>I can possibly get it since I never seen it advertised.
>Also, does a TT need a swtich box/adapter to be used with a
>multysync or VGA monitor?
>Thanks in advance
>...
>Ling Cherd

Besides, if you can get a monitor, that is digitally controlled, this can make a lot of a difference for you. With regular MultiSync monitors you will have to adjust the screen geometry when switching between modes. With a digitally controlled monitor this is usually not necessary!

5570. Connect 1.96 still won't work!!!

Newsgroup: comp.sys.atari.st
Date: 1993-04-18 16:13:31 UTC
From: richardson@sscl.uwo.ca
Message-ID: <1993Apr18.121331.1@sscl.uwo.ca>
Source record: 207301

Well, I have finally given up on getting Connect 1.96 to work! I tried everything I could think of, and a few suggestions from others...to no avail!!! Whenever I tried to run it I got a message telling me that 'connect.prg must be in the same folder to run the demo'...whatever that means! I tried renaming the demo to connect.prg, renaming the folder to 'connect', placing everything on the root directory, and a few other move/rename type things...nothing! If anyone had the same problem and figured it out let me know. BTW, the docs say connect WILL work with all TOS versions, including the 1.0 I have! Any suggestions?

>may possess the model that was exhibited at Atari Messe/Comdex
>which were definitely the 'wait-stated' units.

...

In this case I'm just playing with semantics, but from the
history of the Falcon, it isn't true that "production Falcons"
are not "wait-state Falcons". According to the reports we got
on the Net, Falcons were sold in Europe to the public last
year, in the state that Ian's was. Maybe "wait state" Falcons
won't be sold widely in North America, but if they were "produced"
and "sold to the public", you can't call them "pre-production".
All we can do is hope that this is all true an that your "rev. 4?"
Falcon really is something different at all.

>facts not fiction..

That's an interesting fact that you propose; all of the Unix boxes that are purported to have disk drives attached to them must be fictional then. And the device drivers in the Atari BIOS for disk drive devices that get mapped to things like /dev/a, /dev/b, /dev/c, ... /dev/p must all be completely fictional too.

"Doesn't support disk drives..." Supporting general output devices obviously isn't good enough - you must want archivers have special code to restrict them to use with the devices Atari designed back in the early '80s.

>Unless a Archiver has full output direction it is completely useless to
>most Atari users, another fact...!!!

Which direction were you thinking of? Up? Down?

Zoo can redirect output to lots of places, including pipes. Stick THAT in Lharc's "pipe" and try and smoke it. Actually, lharc might support pipes too. I seriously doubt that zip does, though. And I still haven't found a version of zip that I can run consistently without it bombing. That being under GEM. It just ain't reliable.

If you're not clear about the nature of your complaint, it tends just to sound like so much raving.

>I did not thing that any one used the ANSI C Standard, is that why am
>I reading about all these patches to MINT for the different C
>compilers..??

No, the reason why differing C compilers require slightly different coding is that MiNT contains code that lies outside the ANSI C standard:

- CPU dependent assembly language code because C does not define a "standard assembler" (That would require that C be restricted to running on one particular CPU)
- Atari dependent libraries (for things like BIOS/device driver support), which lie outside any C standards.

MiNT is necessarily somewhat non-portable by its nature as systems software specialized to the Atari ST.

>By the way my Atari has disk drives A and B,

So use a RAMdisk, like I did when I had a 1MB, no hard drive, _single_
floppy system. Zoo worked like a charm.

> [...] and ZOO and all this other
>Unix crap does not support Disk dives,

Um, is that why `zoo x// a:/fred.zoo' works fine? Looks like support to
me.

>Unless a Archiver has full output direction it is completely useless to
>most Atari users, another fact...!!!

Sigh. Output redirection can be faked from the desktop, and even more
easily from a CLI. Your point is empty.

And I'd have to say Zoo gets enough use around here that it can hardly
be accused of being "useless to most Atari users".

>I did not thing that any one used the ANSI C Standard, is that why am I reading
>about all these patches to MINT for the different C compilers..??

That settles it, you must be a user. No hacker could be this clueless.

Roger, the Standard leaves enough details unspecified (sizes of the
various types, for instance), that even two standard-conforming compilers
can vary substantially. And if the source to MiNT takes advantage of
any of the extensions of its native compiler (GCC, I believe, which is
notorious for such features), then yes, it will have to be modified for
compilers that don't have those extensions.

>More Facts less Fiction..:-)...

I'm still not holding my breath.

5577. PC-SPEED for sale

Newsgroup: comp.sys.atari.st
Date: 1993-04-18 18:47:29 UTC
From: marsh@gwdgv1.gwdg.de
Message-ID: <CKOCB4ZI@gwdu03.gwdg.de>
Source record: 207307

Dear Netters,

I have a PC-SPEED (version 1.4) for sale. Original (german) manual and system disk included. I used many DOS programs and did not find any which I could not get run on PC-SPEED. The manual provides a detailed description how to build in the board into 260 and 520 ST, 1040 STF and Mega ST. I have built it myself into a 1040 STFM and used it with no problem. The reason I don't need it anymore is that I want to buy a Falcon and no need to be compattible with my working place any more. As having no idea about the prices, best offer takes it.
For those who don't know what PC-SPEED is: It as a DOS emulator for the ST's consisting of a combination of hard- and software and running at about a speed of an 8MHz XT. Emulates various graphic modes, uses the ST mouse and ports, can create DOS partition on a harddisk and boot from there, read/writes DOS disks.

Please email me directly,

Tibor

>or 5.1 files with Microsoft Word 3.2 or 4.0, so you can't take stuff done on
>the latest version of Mac Software and make it work on an older version.

This is *not* true. Word 4 reads Word 5 files! I bought word 5 before our
labs were updated to Word 5, and the file format is the same. It's extensible
so the stuff that Word 5 added, is just ignored by Word 4, but Word 4 knows
leave it alone. I got snagged by this a few times when some of my graphic
additions wouldn't print on campus! I can't believe I'm defending a
Microsoft product! And in an Atari group! (Sorry!) But the statement
was just blatently FALSE! I've *done* it!

>only accept OLD versions of software like MS Word or Aldus Pagemaker. Try
>finding those anywhere. In fact, try going to a Mac dealer and purchasing
>sytem 6.5 or 6.4 system/finder. YOU CAN'T! They don't sell them anymore. So

Are you sure? My father just went down to the local computer store and
picked up Sys 6 (free!) because Sys 7 was eating too much memory on his
powerbook 100. It was probably 6 months ago but no more than that! I think
Apple might have older System versions accessable from the Net. Apple
doesn't seem so paranoid about Sys 6 and they used to. You have a
legitimate beef as far as System 7 goes though (I undersatand Dave's
working on it?). But, alot of software runs under Sys 6, just losing
Sys 7 features (Word 5 is an example.)

You can take my comments in the light that I don't own Spectre..but if
what you want is a Mac, buy a Mac. If you want an ST first...Spectre is
a good buy.

] Isn't that about what a Falcon030 4/65 is supposed to cost, roughly?
] And its faster and can take more RAM (not to mention SIMMs instead of
] extra-expensive proprietary RAM expansions)...

The fancy RAM is almost the same as SIMM's in price (I'm not going by
the mega-cheap $30 SIMM's of course)

Basically, the LC-III for general home purpose is the better machine (and
for business use). But if you want the pretty graphics/sound etc.,
the F030 wins.
```

FWIW, the Omniswitch sucks. If you can find a used Omnix3 from Omnimon
Peripherals (Wuztek), get it. The IB Computer's switchbox (I think it might
be called MultiSwitch) is also good. ATY Computers in Oakland, CA will make
a custom switchbox for you as well.

What if a computer come out that was much faster than the Falcon, had a 32-bit system-wide bus, more color capabilities than the Falcon, better sound than the Falcon, and was backed by a company that was better than Atari at providing what the user wanted and supporting the user and computer? The only problem was... this computer is starting out like the 520ST's and 1040ST's... no real software at first, but software (and HOW!) would come in time. As well, this greater machine cost $1500-$2000 without a monitor. Would you buy it? Would you consider buying it?

As well, this system was NOT compatible with any other systems currently made, except for the generic features like ASCII, RS-232, parallel port, etc. It had a new GUI OS. Would it be interesting? Would it set your teeth on edge? Would it turn your hair to flame? Would you run out and buy one immediately?

Make all replies to this message in Email to: jared@midiline.la.ca.us

I've used Spectre --on a TT!-- regularly for over 18 months now.
Once I got past the now well-known problems with floppies (works fine now),
I've been quite happy with the product. It's stable and has run everything
I've thrown at it, except for VIRTUAL (tm), a virtual memory program for
system 6.

The System 7 thing doesn't bother me, but I am looking forward to more
functionality with respect to the TT hardware (SCSI support, multiple
serial ports, etc)

I have to agree with the complaints regarding the lack of customer service.
It wasn't too bad until they temporarily shut down, but hasn't been the same
since they came back.

>program or a spreadsheet. Multitaskings a big help there. And what about
>virtual memory. Well, if you ditch System 7, you'll free up 2 megs and you
>won't need virtual memory.

The problem with Sys 7 is you really need better than a Classic to run it,
and you really need 4 megs. If you have both, and can still prefer Sys 6
we are in two different realms. I do use Sys7 on a 4M SE and I still
prefer Sys 7. The 50% figure is bogus, but Sys 7 is still slower. I still
reguralarly use a SE with Sys 6 as well...so I do have an objective point
to compare. And, when most macs fits this criterion now, it's not that
bad. And you don't need Sys 7 to multitask! Use multifinder for Sys 6!

And, to say, "Who needs it [multitasking] on a Mac?" is really strange!
Almost every user needs it! I just had a lady here who wanted to make some
Graphs so she booted Cricket, make the graphs, pasted them into MacWrite
and moved on! That 10% of the time when you need to bounce off into
another program and bounce back quickly, really makes work go easier.
When you get out of the mode of using one program at a time, you use it
all the time (I know I do!). I haven't used Multitos long enough on
a wide enough section of programs to give a comparison between it and
Sys 6/7. If there is enough interest I might find the time to familiarize
myself more and compare. (And I *do* like multitos.)

You are right about Virtual Memory. It's dog slow and ups the probability
of a crash to almost 1!

>Oh, and do you know about the new Mac emulator that runs on Sun Sparcs?
>It emulates a Classic (not a II) in monochrome only running ONLY 6.0.7.
>And I would guess its price would make Spectre look quite affordable.
>(I've been trying to install the demo version here for the past day--
>without sucess. It doesn't tell the price.)

I've seen it run. Blech. It reeks. They put it in here at OSU in some
obscence effort to move the lower CIS classes onto the Suns w/o changing
the curriculum. In most ways, a Sparc SLC running Liken is no faster than
a PLUS!! (A $500 machine they replace with a $3000 one!) OSU is also having
some legal problem with Apple, I don't know the details, and is going to
have to scrap the program because of it.

>And how often do you have to eject the floppy with a paper clip? I personally
>prefer a button.

I work in a lab with 50 Macs, and I don't have to eject flopies that way all
that often. Reboot/restore crashed macs...about every hour I'd say! But,
I'd sure like a button! Ask me about the sound of 31 Macs spinning down.

>This would seem to be Microsoft's problem (excuse me, but I don't appreciate
>them trying to take over the world). If they weren't so high on themselves,
>they'd make their programs backward compatible. (And by the way, I prefer
>Word 4.0 over 5.0 anyway.)

Ah, we are on different side of some spectrum. Other than a mild speed
issue...how can you say that! I guess you must forgive the numerous
Mac guildeline violations in Word 4, I don't! I use macs to much to do
so! How do you select all in Word 4 again...I forget...is it
Command-Option-m? I know you can reset it..but that does't help in the
lab..and then you have to redo the Find Again or whatever they mapped
Command-A to. And, as I said before, Word 4 *can* read Word 5 documents.
And Word 5 can explicitly save into Word 4 format if asked. This is one
case where Microsoft doesn't deserve the heat...and I can't *believe* I'm
saying that!

[comfirms that you can get Apple System stuff easily]

I hope this mostly Mac-info wasn't *too* offensive. But, in the context
of a Spectre discussion...I thought it (partially) relevant. (Like you need
to know if you'd *want* Sys 7 before you bemoan not being able to run it.)

>price, unlike the Macs. After all, even if Atari dealers could get the
>machines, they couldn't sell enough to allow them to cut their per
>machine margins.

What I say is a sheer statement of fact. We know the retail for the
LC III, and we know the edu and street prices for it. It's for sale.
The Falcon is *not* for sale, and we don't know how much Atari padded the
figure. I have some idea, as I've seen dealer/developer prices for a
Falcon...but I can't comment on those. There *is* room for barganing.
And note, from past margins on Atari products, dealers will be happy to
make a real profit on each machine sold! The profit margin on a STE
sucked! Theres a nice margin in the Falcon prices...and Atari is trying
to get dealers to actually *make* money when they sell a CPU! And note,
no where do I say that there will be a huge difference in street prices
in both machines! Just that we don't know that yet!

I do not know how much an Apple Dealer makes on products, but I believe
it's <10% these days (or about $130 on an LC III).

And, it doesn't matter if the Falcon and the LC III are the same price!
There are people in the music crowd who will buy it irregardless. Want
to raise the Mac to the same sound level? Add the DSP sound effects?
This market is quite different from *you*. You've said you have no
use for the DSP so you choose to ignore it! Others do have a need, and
won't ignore it. And don't come back with the DSP macs. The cheapest one
is going to be about $2500! As I said, I don't know the size of this
market. But it is there. And musicians *do* know about the machine.
NAMM sure loved it as well. There is a rumor that music stores are high
up on the list to get Falcons when they come in. If true, I think it's
a wise move on Atari's part!

(Does this put into shock all those people who read my mac posts????)

That's good because the LC III can't use those SIMMS anyway! For a data point, to add 4M is $120 and to add 8M is $240. You can only add one SIMM but it can be 2,4,8,16,32. But it almost costs more than the computer to buy 16M and it does cost more to get 32 ($2000 I think). And that's *add* to the base 4M. I think a 2M SIMM is $80 but I'm not sure.

I really don't know the price to add memory to the Falcon. I'm just adding the real data for the LC III.

>most Atari users, another fact...!!!

portability implies that a program should NOT have its own GUI interface
because there is no universal GUI (with the possible exception of curses).
Unix systems don't run GEM, and PCs (generic) don't in general run X. IMHO,
archivers should have command-line interfaces only. GUI interfaces on
specific platforms should be provided by driver programs (eg arcshell or
whatever). surely a GEM driver program for zoo, lharc, zip, arc, tar, etc
can be written to handle all these scenarios you constantly bring up. the
implementation details should not cloud the basic issue of portable archives
themselves.

>I did not thing that any one used the ANSI C Standard, is that why am I reading
>about all these patches to MINT for the different C compilers..??

ANSI is a standards body recognized internationally for all computing (not
just unix). the ANSI standard for the C language (per committee X3J11) has
defined a standard for the language that makes it possible to compile programs
unchanged on compliant systems. all serious programmers use ANSI C (or they
risk non-portability). while a weekend hacker on the ST may not care much
about portability, more serious people like Fortune 500 companies, the
US Government, etc (ie the "real world") do. this is not limited to the US
(there are international organizations like ISO which have similar goals).
since i regularly interact with both government (mostly DoD) and business
(most fortune 500's), i know what they want.

the implementation details of ANSI C are independent of the standard itself.
MiNT is patched to make it more ANSI and POSIX compliant so that codes can
be ported more easily to the ST platform (which should make it more useful).

note that ANSI C says nothing about a GUI interface. if they did, i am quite
certain they would not make it GEM :-).

i would think it is certainly in atari's and atari developer's interest to
make programs which could be easily ported from/to other platforms. making
everything a GEM program severely limits this in the long run. unfortunatly,
there is no universal GUI (yet) and it is highly likely that atari itself
would rather fight than switch...

ciao

Well, after hearing you guys talk about the game, I went out and bought it. It works great on my TT (even in TT-RAM!).... except once I crush the other civilization, in which case I get a screwed up screen, some music and 2 to 14 bombs.

I remembered what you guys were talking about and tried renaming the two slam[1,2].lbm to .bbm. It still bombed. I tried copying the .bbm's back to .lbm's and leaving copies of both present. It still bombed. I remembered someone saying to just choose drive A for the save games, so I did. It still bombed.

You guys have had success, right? What else can I try to get it working? Thanks!

5595. An open letter to Gadgets by Small apologists

Newsgroup: comp.sys.atari.st
Date: 1993-04-19 00:19:21 UTC
From: L676791@LMSC5.IS.LMSC.LOCKHEED.COM
Message-ID: <93108.62361.L676791@LMSC5.IS.LMSC.LOCKHEED.COM>
Source record: 207323

A lot of Atari-ites and satisfied Spectre GCR users have jumped to D. Small's defense when I posted harsh words about my experiences with Gadgets by Small customer support. Yes, Spectre GCR is a clever, ingenious device that can greatly enhance an ST's usefulness, and I'm sure that the floppy drive problems that I (and others who have posted on this net) have experienced are fairly easily solved, but that wasn't my main point. Some of you mentioned a potentiometer on the GCR board that could be "tweaked" to help with floppy drive problems, and somebody posted me an "E-mail" message asking me if I got the addendum to the manual that explained this pot and what it was used for. To answer the question, no I did not get the addendum to the manual, nor did either dealer that tried to help me with the product (B&C Computer of Santa Clara, CA; and San Jose Computer of San Jose, CA). Both tried contacting Gadgets by Small by mail, phone, and GEnie E-mail. (I now have GEnie also, by the way). I tried phoning, writing letters, and FAXing. Nothing. They could have at least sent me this mystery addendum to the manual. So, if by all of this flaming I manage to get some updated literature - great. I mean how much can a photocopied piece of paper and a stamp cost? Hey, I paid $250 for Spectre GCR and another $250 for the Mac ROMS. When you're spending hours (and dollars) trying to get the thing to work, it tends to make one a bit upset when the company that sells (and continues to sell and profit from) a product, refuses to help out, especially when they purported to give such great customer support. As for the claims that Mac dealers are giving away system 6.X.X system/finder, that is NOT true. A couple of months ago, Apple clamped down on dealers giving it away. Not a major problem, but something to think about (just to set the record straight.) Of course, one might say - if you want a Mac, go out and buy a damned Mac. In fact, I do like my Mega STe, and am fairly satisfied with the fact that I can swap Word Processing files back and forth between my Atari and Macintoshes at work. (By the way, when's the last time anyone saw a company with Atari computers for its employees?) But that's another issue. So, if Dave Small wants to call me and cuss me out for badmouthing his customer support, he's welcome to. At least I won't be ignored like I was when I needed the support. Oh sure, some will call me a crybaby and tell me to go figure it out for myself, but I was pissed. As for Spectre system 7, color, and Falcon support? VAPORWARE!

I for one am not going to sit by and say nothing if an Atari developer shows contempt for me as a customer, just so as not to offend one of the few Atari developers left in the world. I'm sure D. Small is a nice guy, because he seems to have legions of faithful supporters and satisfied customers, but when I spend hours of frustration, my only recourse is to flame, flame, flame. What is the saying?? - If you can't stand the heat, get out of the kitchen.

Not having a Falcon to compare to other computers I've used I'll just say a few things.....

When we are comparing the Falcon to a 386 DOS box... what exactly are we comparing ?? The hardware or software ?? And what OS (or GUI) are you using on the 386 machine that you are comparing to a Falcon ??

Subjectively, I can say the following honestly....

- My Mega STe (using Warp9 or any of its ancestors & NOT running MiNT) beats a MAC LCII for screen redraws...

- The affore-mentioned STe beats a VAXstation 3100 (running nothing but DECwindows) when redrawing its screen.

- The 486DX2@66mhz I have on my desk at work running MS-Windows is just as fast at drawing windows as my Mega STe at home.

- My Mega STE beats the pants off my PDP-8 compatible DECMate II's.

- I won't tell you how my Mega STe stacks up against our new VAX 4600's :-).

What does this prove ? Nothing !!!!!!! But until I can afford a DEC AXP workstation running OpenVMS for home I think I'll stick with the Atari ST and its descendants.

Until somebody can give me some objective numbers instead of subjective answers about the different speeds of different computers.... I'll believe my own eyes...

This sort of stuff belongs in the .advocacy group.... while any REAL Numbers [tm] belong in the .tech group.

>> depresses me about the Falcon.

Whoever it was that said this doesn't understand what is going on.

Many PC graphics boards have a Text mode that is a CHARACTER screen. No
graphics. Remember those on the 8-bit Atari? Such modes are no longer
designed into computer hardware because even though GRAPHICAL screens
take 8 to 16 times as much bit moving to process a graphical screen
(since the characters are now 8 to 16 bytes high, rather than just one byte),
text modes are generally for human-reading, which the computer can EASILY
keep up with, and the simpler graphics boards means superior engineering.

Text modes are an old compatibility shadow left over from the days of
1MHz IBM XTs that were used for totally text-based applications - simple
word-processors, simple spreadsheets, etc.

Cross-posted to: misc.forsale.computers.other,comp.sys.palmtops,ba.market.misc,misc.forsale,comp.sys.atari.st

I have a few miscellaneous items for sale:

1- KODAK Diconix 150 Portable Inkjet Printer
-uses HP Inkjet cartridges
-battery or AC operated (batteries included)
-smaller than a sheet of paper
-uses Jet paper or plain bond

$150 - shipping extra

2- US ROBOTICS WorldPort 2400 Modem (NEW)
-works right out of the box with HP95LX
-recommended by HP
-9V battery or AC adaptor

$150 - shipping extra

3- Radio Shack Acoustic Adapter for above
-powered by modem
-includes USR cable

$50 - shipping extra

4- ATARI 520ST Computer w/Monochrome monitor
-includes external floppy drive
-power supplies, mouse, cables included
-two boxes of software included

$250 - shipping extra

No CODs. MO or checks accepted in advance payment.

ilepore@nyx.cs.du.edu (Ian Lepore) writes:

> When I tried to port Ani Pro playback to the Falcon [it was 1/10th the speed]

>The problem, quite simply, is
>the Falcon's brain-dead interleaved bit plane scheme for storing pixels in
>256-color mode. If the Falcon supported byte-a-pixel (aka packed-pixel)
>video memory layout, I have no doubt it would run circles around the
>386/25 machine.)

Here is a typical case of a blind port. If Ian used the Falcon's TrueColour mode, his prayers would be answered. The TrueColour mode is 1 word per pixel.

As this is a tech group, I'd like to re-raise this point about types of video memory layout.

Basically, there are three common types of video layout:

1. Bit interleaved bitplanes.
2. Word interleaved bitplanes.
3. Bitplane interleaved bitplanes.

These mean:

1. Bit interleaved bitplanes.

Bits of a pixel are adjacent in memory. For example, 1 byte per pixel means all 8 bits of a 256colour pixel are in one byte [eg. ModeX on VGA cards]. 1 word per pixel means all 16 bits of a 65536colour pixel are in one word [eg. TrueColour on Falcons]. 2 pixels per byte means all 4 bits of a 16colour pixel are adjacent in one byte [eg. GTIA modes on 8bit Ataris]. 4 pixels per byte means all 2 bits of a 4colour pixel are adjacent in one byte [eg. graphics mode 7 on 8bit Ataris]. Got that yet?

2. Word interleaved bitplanes.

Bits of a pixel are in corresponding positions in adjacent words of memory. For example, in a 16-colour mode, the bits for a pixel are at the same bit position in 4 adjacent words of memory [eg. ST Low rez].

3. Bitplane interleaved bitplanes.

Bits of a pixel are in the same position in completely
separate bitplanes (expanses of memory). For example,
in a 16-colour mode, all the first bits of pixels are
in one area of memory, followed by all the second bits
of pixels, etc. [eg. Standard Amiga graphics modes]

Now, to say that one system is better than another (or to say that one
is more "brain-dead" than another) is pure naivety. Each style has
greater and lesser consequences.

One of the greatest advantages of (3) is that you don't have to use all
the bitplanes. (2) also has this advantage, but has the added advantage
that when you do use all bitplanes, access is still very fast (because it
is still local).

The big advantage of (1) comes when using pixel-based operations (such
as lines) rather than raster-based operations (such as sprites & blits).

It is only logical that "business oriented" machines such as PC clones
focus on pixel-oriented modes, while "games oriented" machines such as
Atari and Amiga use raster-oriented modes.

The Falcon gives you the very best of both worlds - word-interleaved
modes right up to 8 interleaved bitplanes, and a 16-bit (word-per-pixel)
bit interleaved mode.

IMO, you can't ASK for much more than that (except extremes like 24-bit,
32-bit), but Ian would complain about those too ("Waaaaa, you have to modify
4 bytes just to change one pixel!")

I have the following items for sale -

1- Olympia NP compact 9 pin printer.
Has both serial and parallel interfaces - good workhorse of a
printer - also has NLQ mode - about 100 cps
Price: $100 or best offer

2- Atari ST - 4 meg memory and 16Mhz upgrade with mouse etc.
Price: SOLD

3- 2 800K SF314 floppy drives with power supplies
Price: SOLD

4- SM125 Monochrome monitor
Price: SOLD

5- SM1224 Colour monitor
Price: $ 100.00

6- Spectre GCR with 128K MAC ROMS
Price: SOLD

7- Supra 30 Meg hard drive partitioned as 20 Meg MAC drive and
10 Meg ST drive - Tons of Mac software to use with GCR
Price: $ 200.00

8- Atari 520ST power supply
Price: $25.00

Prices are negotiable as is shipping

Contact: Leonard Harris
(403) 438-7834 or EMAIL

Dateline Atari! with Bob Brodie
Special Guest - James Grunke
Host - Lou Rocha

Wed., April 14, 1993

Ed. Note - Bob Brodie did all the online typing for
this RTC. All music-related answers were provided by
James Grunke. Non-music questions were answered by
Bob Brodie.

<[Host] ST.LOU> Welcome to the second half of this week's Double Dateline! Real Time Conferences. Tonight Music Expert James Grunke joins Bob Brodie to discuss the Falcon030's music capabilities. James has been here before so no need to be too gentle :-) You can ask him any technical questions you may have about the Falcon or the music software it will run. You are also welcomed to ask any questions regarding the Falcon in general. Without further ado, here are our guests. Bob, please introduce James and make the opening comments.

<BOB-BRODIE> Thank you, Lou. I'm pleased to welcome our members to another edition of Dateline Atari! Thanks for all of the encouraging words that were sent when I had to cancel the last one due to illness, we appreciate your understanding.

We had a wonderful time on GEnie on Monday night with Pradip to discuss Atari Works!!! It's great to be back online again so quickly for another GEnie Real Time Conference on our official online resource.

James Grunke is alongside me tonight. This is his third year as the Director of Atari Musics. He is in charge of sales and marketing in the US for the music channel. He is also responsible for international music developer marketing support. James has recently brought on board over sixteen manufacturer rep firms specializing in Music and Pro Audio channel. This effectively provides James a staff of over 50 people on the street carrying the Atari flag, and supporting Atari dealers!! Simply put, these guys are the best in the business!!!

James brings to Atari a business background in digital music sales with companies such as Mission Bay Investments, and Delian Music Systems. He's spent many hours on retail sales floors, and knows the mindset of the Atari Music customer.

His music background includes time spent as a staff synthesist and digital sound engineer with the Beach Boys/Brother Records, specifically contributing to the Still Cruisin' album. He has also played keyboards for the Beach Boys while on tour. Other bands that James has contributed his musical and technical expertise to include Crosby, Stills & Nash, The Band, and Michael W. Smith, as well as a number of video soundtracks.

James earned a Bachelor of Science in Keyboard Performance from the University of Wisconsin and also holds a degree in synthesizer programming from the Grove School in Los Angeles. He is a member of the National Association of Music Merchants (NAMM). Recently, James was elected to the Executive Board of Directors of the MIDI manufacturers Association. (MMA)

Tonight, we want to talk with you about Atari Music, and the Atari Falcon030 specifically. The Atari Falcon030 is more than a computer, it is a musical instrument. EQ Magazine recently awarded the Atari Falcon030 it's coveted "Blue Ribbon" Award - the only personal computer recognized by the award winning magazine as an important new contender in the pro music and recording industries. By blending CD quality audio, digital signal processing, video genlock, video overlay and MIDI, the Atari Falcon030 puts recording and video studio capabilities directly in the hands of pro and amateur musicians. You can't find these capabilities for this price anywhere else, proving that sometimes you have to spend a little less to get a lot more.

Music is about self-expression. Music video and computer assistance are tools that allow for greater expressiveness, and the Atari Falcon030 is the one computer that can help today's musician master both these media to create revolutionary artistic statements.

The Atari Falcon030 offers users "Quad Processing Power"!!! The Falcon030's exceptional performance comes from the smooth integration of four processors:

Motorola 68030 microprocessor running at 16Mhz
Motorola 56001 DSP chip running at 32 MHz
SDMA sound coprocessor
BLiTTER(tm) co-processor for extraordinary graphics capabilities

These function in a Direct Memory Access (DMA) environment using a multi-tasking operating system, which results in hardware so powerful that even inexperienced users can mix audio, video, animation, text, and graphics right out of the box. Atari has a long-standing relationship with the music industry. In the mid-80s, Atari was the first computer company to market to musicians at the National Association of Music Merchants (NAMM) convention and to distribute through music stores. Part of Atari's rapid acceptance was due the inclusion of MIDI ports (another Atari first), and part was Atari's "Power without the Price" philosophy. This same philosophy has culminated in the Atari Falcon030, which delivers exceptional audio and video as well as music performance.

The Atari Falcon030 ships with stereo CD quality digital audio out of the box. The system is capable of eight independent sixteen bit audio tracks. At this point in development, there are four track systems available from third party developers, such as D2D Systems Ltd. 4T/FX. Innovative products are also on the way from Barefoot Software, EMAGIC, Steinberg, Dr. T's, and many other developers. If you would like to have a complete software listing of Atari Music developers, send James email here on GEnie at JAMES-GRUNKE.

Although James hasn't been publically active on GEnie, he's been lurking for quite sometime now! <grin> He follows of course, the Atari RT Bulletin Board, and also keeps up with the MIDI RT. When James picks up a magazine, he reads the Letters to the Editor section first. When he logs on to GEnie, he goes to the MIDI RT and reads the messages in the OLD ATARI USERS LAUGHING AT FALCON (Cat 49, Topic 10/ MIDI RT). His acronym for this is OAULAF. We're told that in Swedish that means, "Thick men crashing through the woods". Appropriate, isn't it?? <GRIN>

James really appreciates those folks who support the positive postings in that topic as well as the other areas on GEnie! And with that, we're ready to take any questions that are ready for us tonight, Lou! Let's rock 'n roll!!!

<[Host] ST.LOU> Thanks for the great introduction. I feel like I've known James all my life! Our first question is from John Brenner.

<[John B.] J.BRENNER1> Well, I had other questions in mind but since James is here for music.....I have heard the output of the Falcon is heavily bass boosted to use with headphones much like a Discman. Is this equalization a hard wired circuit or is it done with the DSP and therefore can be cancelled to get flat sound for pro use?

<BOB-BRODIE> The bass boost section was killed at the request of the music developers so that audio would run flat. So it's no longer a concern, John.

<[John B.] J.BRENNER1> That is great news Bob. Will there be a listing of Canadian pricing soon?

<BOB-BRODIE> Yes, we will be doing a mailing to our Canadian dealers this week.

<E.NIKOLAISE2> Bob, I'm the Pres. of Stun (A ST Users Club in Utah), our next meeting will be April 21. Will I be able to "demo" a Falcon 030 to the club by this date?

<BOB-BRODIE> It's not out of the realm of possiblity, Erik. It depends on the relationship you have with the dealers in Utah. Be sure to check with them, as we have several new prospects as well as the existing ones, like J & J for example.

<[Rob] R.ANISKO> I am curious as to how I would go about interfacing an electric guitar with the Falcon - would it be treated specially, or could it be used with a typical MIDI application transparently?

<BOB-BRODIE> The audio input to Falcon is a stereo mini jack. You could for example using Barefoot SMPTE Track Audio, or D2D or soon to be released Cubase Audio, use MIDI tracks and combine them with your digital audio guitar tracks.

<[Rob] R.ANISKO> Also, how would MIDI be affected by accelerators such as the 32mhz accelerator mentioned in one of the RTC's about Cebit...?

<BOB-BRODIE> We haven't been able to test one yet specifically with MIDI.

<[Matt] M.RIVMAN1> My local Sam Ash guru is pro Mac. Mark of the Unicorn stuff does more than Atari software. How do we get him back? Any port of M of U stuff in the works?

<BOB-BRODIE> Although we are working with Mark of the Unicorn, we can't comment specifically on their software direction. However, it is convenient that their MIDI expansion hardware shares the same port connectors as on the Falcon. No promises, but we are looking into that relationship. As far as getting your local Sam Ash guru back with us, we're confident that when customers begin to come into their stores requesting Falcons, many Americans will re-think their perception of Atari Computers, and what they really can do. While Mark of the Unicorn software is excellent, I'd be hard pressed to find something that we cannot do on an Atari Falcon030.

<[Matt] M.RIVMAN1> He specifically mentioned the many different sync-ups allowed, SMPTE,etc. I hope the available software for Atari is VERY flexible! He was impressed with the specs I showed

him, but still was hesitant! I'll keep trying! Thanks

<[Andy] O-ZONE> I am especially interested in the capabilities of the D2D software. The opportunity to do real time sequencing and direct to disk digital audio has me enthralled. How soon can we expect availible software to offer us the use of 8 channels of digital audio?

<BOB-BRODIE> Currently the shrink wrapped D2D software uses four tracks. They are working directly with Barefoot Software to integrate MIDI into Digital Audio. We expect that it will take some time to get 8 independent channels, however we understand that four stereo channels is on the way. This is really an issue for the individual music developer companies to make their own delivery date announcements.

<[STimpy] J.TORRES17> I keep defending Atari at work (Staples) They don't think Atari exists! Are there any plans for some mainstream ads for Atari and Atari Music (like Time, Newsweek, etc.?

<BOB-BRODIE> Over the past year, we did six ads with Digital F/X, 6 with EMAGIC, formerly C-Lab, and over a dozen ads with the Fostex campaign. These were all placed in publications like Mix, EM, Keyboard. You can look for aggressive vertical marketing into the music channel in the very near future.

<[Pat] P.FORISTER> I've heard that the sound level on the Falcon is maxxed out when the computer is first turned on. Is this something that can be configured in NV-RAM? Or has the sound level been turned down?

<BOB-BRODIE> The sound system at boot up reacts just like the TT and Mega STE there is a program you can run from your auto folder that will configure the audio level called SNDXX that will be available.

<[Jason] J.BRUNKEN> I am interested in the video and genlock capabilities mentioned in the introduction. What low cost genlocks are under development and how soon do you think that they will be available? Also, I hear that some high powered NeXT apps are being converted to the falcon, any truth to this?

<BOB-BRODIE> Bill Rehbock tells us that there are no less than three under development, including the John Russell Innovations one from here in the US, OverScan which will be distributed by Compo, as well as the unnamed one from France, all of which cost less than $500. One of them should come in around $249. They will be available before June, according to the representatives from the respective companies. They all run in True Color modes. Re the NeXT apps, there are a number of different ones. They are excited about the availability of the DSP Chip...for example Singular Solutions, and DOA. Some of the other NeXT developers

are still in the TOS learning curve.

<[James] J.BRENNER1> Bob, have any Montreal dealers signed the new Atari Dealer Agreement and if you can tell me who, I'll be the first Montrealer to buy a Falcon. Will Atari Works ship with the first shipment?

<BOB-BRODIE> We are just sending out the dealer agreements to Canada this week, James. I'll be sure to put a note on all the ones for Montreal all and tell those dealers to call you. <grin> We just got back the manual for Atari Works... maybe it will make the first shipment, but I'm not 100% sure yet.

<[Guitar Cente] C.FLUEGEL> OK, so I buy a Falcon. What recording software will be available that day? I know of many in the works, but are any finished and shipping in the USA? Also, I here that D2D is quite crippled and unusable in any serious work (no editing!?) Is this true?

<BOB-BRODIE> The D2D software that is bundled with the machine is designed for consumer use. It has very limited editing.
Available shrink wrapped products from D2D include 2 and 4 track systems with the four track system having DSP audio effects. I believe the release date for Cubase Audio is sometime this spring, early summer. Please contact Steinberg/Jones for confirmation.
At CeBIT, there was a program from a company called TradeiT, reportedly using SIX tracks. We will look into obtaining a US distributor for this product in order to ensure it's availability.

<[Jeff] J.WHITE99> James, of particular interest to dealers seems to be the broadbase marketing plan. How will we attract new users. Can that be addressed here?

<BOB-BRODIE> Certainly, Jeff. The machine has natural appeal to musicians and we feel that one of the firmest ways to get footholds in this market is by reaching out to the music educators. Not only is the hardware exactly what musicians want, the price point makes it reachable for educators. We know how the recession has affected education budgets in general. Look for us to support music educators as a base for our music launch.

<S.EAKINS> Hi Bob, just got here, so I hope that I am not reasking a question. Will modems become obsolete with the new DSP chip? Are there any special adapters needed to connect up to the Falcon, I won't simply plug in my phone line, right?

<BOB-BRODIE> Scott, no problem. Glad you could make it here tonight to join us in the Dateline Atari! Session. There is no problem in using existing modems with the Atari Falcon030. The serial port works just fine. I've used STalker 3 at speeds of up to 19.2K baud, and the Supra FAX Modem as well. There is a DSP modem that is under development. It will be about the size of a pack of cards, and you will plug your phone line in there. This

product is projected to be available late this summer.

<[Pat] P.FORISTER> Bob, can you give us any _firm_ dates on availability of Falcons, and in what quantity? Hopefully the initial quantities will be enough to supply all of the starving Atarians out there. When will your warehouse be restocked?

<BOB-BRODIE> Pat, as I indicated on Monday night, the Falcons are here. We have them in the warehouse (I personally went over to check.... I didn't want to take anyone's word on this!!!) They will be going thru a Quality Assurance process that will take a couple of days (one of which is elapsed already), so I think we will be sending them out the door on Friday. These are the demo units for our dealers, and the next shipment will be in about 2-3 weeks These dates are VERY firm, Pat. I'm very pleased that the units are in stock FINALLY, and the dealer agreements have been just POURING in since we made a little announcement in AEO, got the reps on the phone, and of course, used GEnie on Monday night to tell the world that the Falcons are truly here!!!

<[(Brad)] B.SUSLOVIC> Hi Bob. I understand that the new dealer agreement has put some mail order limitations on dealers. Under what circumstances will consumers be able to purchase Falcons via mail order?

<BOB-BRODIE> Brad, we're trying to build a dealer network up again. In order to do that, we need to have storefront locations selling our product. We recognize that in some rural, or remote areas there is a likelihood that there will not be a local dealer. In these cases, we will make arrangements with the closest dealer to you to handle the customer.

<[Host] ST.LOU> Let's pause for a minute. Our door prize tonight is a subscription to Atari Explorer. What is the ID number for the DSP chip? 30 seconds to talk-mode. First two correct answers will win.

<[david k.] D.KAUFMAN> Motorola 56001

<[STimpy] J.TORRES17> Yak Shaving Day!
<[Ron] Z-NET> I won already! :-) Monday!
<[Fred] FB> The BIG one?

<[Host] ST.LOU> Bunch of comics :-) David Kaufman and Matt Rivman are our winners! Please send your addresses in email to BOB-BRODIE to get your subscriptions. The answer was 56001

<[John B.] J.BRENNER1> This is not a technical question. On a personal note. Bob, what is the first thing that came to mind when you received the phone call confirming the arrival of Falcons ar customs?

<BOB-BRODIE> It was not a phone call, I was told personally by Garry Tramiel. And I told him "You better not be kidding around with me!"

<MIKE-ALLEN> Most of the talk about the dsp chip has been music related. I wonder if there are other apps that have been explored? I have particular interest in Ham Radio apps and also in using the technology to clean up some vintage recordings. My dad was in radio and tv since 1937 and I have some very interesting recordings that really need help. One in particular of my dad with Bob Hope, Jerry Colona and Frances Langford on Guadalcanal in 1944.

<BOB-BRODIE> There certainly are, Mike. Modems, Data compression, decompression, voice mail, fractal generation, and other things are very possible. Regarding using the DSP to clean up the recordings, you can use the DSP as a audio equalizer to "surgically" clean up recordings using digital audio recording to transfer these recordings into the computer and do the editing on screen there.

<[Pat] P.FORISTER> San Antonio has lost both of its Atari dealers. Do you know if we will be left in the dark for long? How can I find my closest dealer? Also, any news in IBM processor direct cards? Have any benchmarks?

<BOB-BRODIE> Pat, I am personally working with one of the prospects for San Antonio. He has assured me that he is very interested in signing on. We also have a new rep firm for the area, called Highway Marketing. They are charged with signing up new dealers in that area. I believe they are actually based in Dallas, and are primarily aimed at Music and Pro Audio dealers. Re the PC benchmarks, I believe that Bill Rehbock reported a Norton SI rating of 12.1 in his CeBIT Report CO that was held here last week. Be sure to get the transcript out of the library here to get the exact numbers. Bill also described the other emualtors that are under development for the Atari Falcon030 for the PC side of things...there is a 486SX version coming out as well!

<[Jason] J.BRUNKEN> Bob, How many commercial software packages for the Falcon do you estimate will be available by Christmas 93? And is that 2-3 weeks on the 4/65's a 'worst case' estimate? I've already paid for mine!

<BOB-BRODIE> Jason, 2-3 weeks is worst case to get the units in here to us from the factory. I'd add another week for it to get to your dealer in order to be safe...the boat probably doesn't dock near him! :) Re the Falcon apps, that's hard for me to say. I'd prefer again to refer you to the transcript from Bill's CO. I've been swamped and really haven't had much of a chance to speak to him about this yet, and I know that he is really, really excited about a number of applications that he saw at CeBIT. I will say that I envision two issues for the US: 1) How many apps, and 2) Who will sell them? We must take steps to ensure that the products have distribution in North America.

<[Host] ST.LOU> Bob, can you tell us WHO is working on a DSP modem at this time? And what baud could be expected?

<BOB-BRODIE> Non-disclosure prevents me from naming the developer, Lou. Sorry.

<[Tim @ AEO] AEO.8> Whats the latest on the Jaguar and the Lynx? I'd also like to know what the RISC chip in the Jaguar *does*? Graphics or the main brain?

<BOB-BRODIE> Hi Tim, on the LYNX side of things, we're running a full color eight page insert in the gaming magazines (like Game Pro) which is hitting the stores now... it really looks terrific! We have added an 800 number for people to call and order products for the LYNX directly from Atari... it's 1-800-221-EDGE We're really excited, as not only do the ads look great, but they have an offer to buy two games, and get one for free. Be sure to look in your favorite game magazines for the ad! Re the Jaguar, I'm afraid that I can't tell you anything about the technical end of the Jaguar at this time, Tim. Sorry. We're very pleased with the number of developers that we've signed up, and the machine is coming along VERY nicely. We have added about the staff in all of the appropriate areas, like a new VP to head up the Entertainment

Software, Gabriel Baum, and a host of new artists, programmers, testers, etc have been hired to help with Jaguar.

<[Host] ST.LOU> Bob and James, thank you for spending the evening with us. We are all really excited about the imminent availability of the Falcon and sincerely wish it provides great successes for Atari and its loyal users!

<BOB-BRODIE> Thank you Lou, it is always a great pleasure to be online on our offical on-line resource: GEnie. It's easy to see why GEnie is the number one online network for Atarians around the world. Thank you all for attending, and good night.

<[Host] ST.LOU> Everyone is invited to hang around and chat for a few minutes. Don't forget to drop in on April 19 and you could win a free copy of Outline Art 3.0 from DMC Publishing. Our guest will be Nathan Potechin!

Bo: I can tell you that, at the least, the 1040STe has the following,
which are different from the older 1040's:
-blitter chip
-newer TOS (v1.06 at least)
-digital sound hardware
-funky joystick ports that have never been used, to my knowledge

Much of the hardware is the same, to the best of my knowledge.
Oh yeah, one more thing: the STe uses SIMMs

Well the C025913-38 is a DMA Chip, this could be a very early one,
may be it should be replaced by the later one C398739-001A..

Food for thought...

I have a Mega 4 with a 2 chip TOS 1.02 installed in 2 of the 6 ROM sockets. When I plug in the 6 chip TOS 1.04 from my 520 I can't get the system to boot. How can I get the 6 chip 1.04 to work in my Mega? I am not adverse to trace cutting and soldering wires. I need to get this working asap as 1.02 won't access my >16M hard disk partitions. Any help would be greatly appreciated.

>current to actually operate the floppy drive, so when the system tries to draw
>more power and the supply can't handle it, total system voltage drops, causing
>a reboot, and on and on...

When I read the original article describing the reboot problem I wanted
to reply but had useful information to give. This explanation here from Howard
is very valid and prompted my attention. I have had a number of people with
Mega's (mega 4s) come to me with blown power supplies. One fellow even had his
entire mega trashed when his stock supply died (it produced nasty spikes that
killed a bunch of chips). The supply in the mega is a cute little switcher but
it isn't quite large enough to power all the chips (thats a lot of RAM in that
machine for that supply). I would suggest disconnecting the floppy and boot
from the hard disk, if it works then you know there is a floppy problem. I like
Howard's comment because it is consistent with my expereinces and it is not
something I sould check right away (I would zero in on the drive first). The
solution is to put a heftier supply in your mega, or adapt and external supply
with a power jack. Remeber, one person has reported his supply totally killing
his mega. Beware.

I am doing a researc paper for a class and I am using the net as a source.
I need some good kind hearted folks to relate to me what sort of process you
went through to decide on a computer platform to purchase. I am also in need
of the type of information that you came across.

I would like you to answer the following questions for me please.

1.) How did you research the computer market? Explain what meduim (magazine,
newspaper) you used to come to a dicision. (I am looking for mediums that are
not advertized as platform specific.)

2.)What type of information did you find in these sources? Specifically,
did you find them to be one sided or biased? I would like an explaination
and examples for this.

Any and all responces are appreciated. Please e-mail as this in not a general
interest topic and I do not read this group often.

Thank You in advance.

5611. Flow problems?

Newsgroup: comp.sys.atari.st
Date: 1993-04-19 08:01:24 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1qtm8kINNntt@golem.wcc.govt.nz>
Source record: 207343

I'm trying to use a 9600 modem on my st, with FreeZe Dried Terminal, on a TOS 1.02 machine (which apparently doesn't have any serial problems...)

However, as soon as I start using the Flow-control to make the ST talk to the modem at locked-19.2k speed, problems start happening, and I'm pretty sure it's something to do with my flow-control setup.

I can upload small files without problems, but larger files can cause the upload to lock up, or even disconnect. with flow control turned off on the modem, and RTS/CTS turned on in FZT, I got speeds of up to around 3400cps, which can't be right! (I was using v.42 not v.42bis).

This is my basic setup:/

```
] ACTIVE PROFILE:
] B1 E1 L0 M0 Q0 V1 X4 &C1 &D2 &G0 &L0 &P0 &R0 &S0 &X0
]
] ERROR CONTROL COMMANDS:
] \A3 \B3 \C0 \G0 \J0 \K5 \N0 \Q3 \T000 \V1 \W0 \X0 %A000 %C0 -P0
```

The flow control commands are \Q and \G

\Q has:/

```
0 Disable Flow Control
1 Bidirectional XON/XOFF enabled
2 CTS hardware flow control (default)
3 RTS/CTS hardware flow control
4 XON/XOFF send only
```

\G has

```
0 Disable modem port flow control
1 Set modem port flow control to XON/XOFF
```

(\G Selects the modem port flow control method used, and \Q Determines the flow control method used between modem and computer)

What should my settings be, and do I have RTS/CTS or XON/XOFF turned on in FreeZe Dried Terminal?

(Also, Does Z-Modem have flow control, Y-Modem G does, but I don't know about Z-Modem, I ws using Y-Modem G when I was getting the 3000cps+ speeds!)

Downloading and normal usage works fine, uploading is another matter!

Help!!

(E-Mail replies would probably be best!)

The MiNT patches that I posted for PureC only cure warning messages. Different
compilers have different strengths in finding out possible errors (and then
they spit out warning messages). That's all.

What would interest me is how a Falcon compares to a 486 (e.g. 25MHz or
33MHz) system on gcc and/or TeX. Preferably with the 486 running Linux. Is
there anyone around that has experience with this? Or could run one of the
standard LaTeX files through these machines?

Date: 1993-04-19 09:53:41 UTC
From: gah@zoo.bt.co.uk
Message-ID: <1993Apr19.095341.12483@zoo.bt.co.uk>
Source record: 207219

Please ignore my ignorance, but I am doing a favour for someone.

I recently got talking to a disabled chap at my local pub who writes his own music on an Atari 520 ST. I have told him all about Usenet, anonymous ftp etc etc, and have foolishly promised to get him some music programs etc. I have a couple of questions, though. I am on a Sun and I have no access to an Atari. I need to know whether it is possible for an Atari ST to read MS-DOS disks (low or high density), or, if not, whether a utility exists (for either Unix or the PC) to write to Atari ST-formatted disks.

I have no problem with accessing anonymous ftp sites etc, so please reply with site names, utility names and any help that you can give. E-mail preferred.

Thanks in advance.

With all these tasty Gif viewers being talked about, I wonderd if anyone could recommend an FTP site with a supply of Gifs to put in them? Preferably in the U.K. or at least Europe.

Ta very much

Sam.

>
I've had this happen on one game. It was on prince level, and I'd spent far too long tossing around on my own continent, so when I met the chinese they were far more advanced than me. I spent the rest of the game trying to avoid being wiped out, until finally I managed to take their capital, causing a civil war and splitting their civilisation in two. This put me in the lead, and I was really looking forward to wiping them out completely, except every time I took another city it bombed (city display comes up, info button is highlighted, food in food store changes to food shortage icon, and in a few seconds it gives a bus error). I have a save game file that reliably reproduces this, so I'll stick it on a floppy and send it in with my registration card. Whether they'll do anything with it is another matter.

Source record: 207201

I have tried 3 PC Emulators so far, and all I wnat to do is run one piece of PC software to convert MIDI files to VFX-SD format. This software uses lots of calls to the BIOS for strange disk formats etc.

1. PC-Ditto 3.64 software only emulator, very, very slow and keyboard handling a bit poor, but worked ok with my one piece of PC software. Formats ok, R/W ok and conversion ok. Disk partitions DOS/TOS compatible.

2. AT-Speed C-16 hardware/software emulator (16Mhz 286). This was a much better piece of kit, quite quick and everything worked ok, but a slight bug in the floppy disk handling which made my software unusable. Disk partitions DOS/TOS compatible.

3. Vortex AT-Once 386-SX A very grand title for a very nice hardware/software emulator (16mhz 386-SX). This was the best and most expensive of all the emulators that I've tried. My software works ok, except that I can't format VFX-SD disk on it. No problem cause my VFX-SD can format it's own disks. Very fast and you can run windows and use the mouse etc. Also comes with a Switcher software that allows upto 8 virtual atari's.
I tried setting up 3 4mb ST's and it worked ok execpt that all the sequencer clocks that were running lost timing.

All of the emulators used the Hard drive, although PC-Ditto would not boot from it. Only able to use GEM partitions so size limited to 10-15mb. DOS drive C only available to DOS, other drives DOS/TOS compatible.

Rgds

Craig

>Thanks,
>
>Julian

There is no such thing, the STE were using the same chip as the first ST's but that gave problems in the STE, so Atari came out with a newer DMA chip Part No, is C0398739-001A

There are other DMA part No. that I have seen with the IMP brand on the IC, they could be OK...!!!

So please quote that part No. but it looks like to me that they don't wish to sell you a chip, but they will fix it for you..??

5625. ? SPICE ?

Newsgroup: comp.sys.atari.st
Date: 1993-04-19 11:51:19 UTC
From: e2nida3@etek.chalmers.se
Message-ID: <1993Apr19.115119.12805@etek.chalmers.se>
Source record: 207209

Is there any public program that is similar to SPICE ?

We will use it at school on our UNIX system so I would like to be able to
run it at home.

If not is there any comercial programs that is SPICE compatibel for the ST/TT/FALCON ?

Or are there any that will be released and use the DSP on the FALCON ?
(eg. for simulating a test signal for testing circuits..., or speed up
the calculation speed.)

Thanks in advance !

Yours,
Niklas D.

5628. TFMX player for ST?

Newsgroup: comp.sys.atari.st
Date: 1993-04-19 12:30:52 UTC
From: mcsdc1ph@dct.ac.uk
Message-ID: <1993Apr19.123053.5205@dct.ac.uk>
Source record: 207203

Hi, everybody.

Does anyone know if there is a TFMX sound-player routine for st/ste?

For the unititiated - TFMX - is a particular music format akin to .MODs, but in a completely different format.

I'm after a routine so that I can play a lot of Chris Hulsbeck's Amobea tunes on my 1040Ste, I am particularly after the Monkey Island tunes.

Can anyone help?

Cheers,

Feekzoid

Last Sunday Atari Australia held a "Warehouse Clearance Day
to make way for some new arrivals. The FALCON030, the NEW
LYNX and the JAGUAR------"
The flier announcing the sale was sent to members of user
groups and I believe it may have also been placed in the
Sydney press.
Some bargains were; Lynx $99 -$70 saving; Computers from $399
Portfolio $260 -$135 saving; Also advertised were 7800 and
2600 machines from $38 and games from 50c. ST software from
$10 ++ "Special Hackers Bin full of hundreds of treasures".
(All prices are AUS dollars).
Apparently the day was supported by the presence of two
stars from a major Sydney FM radio station and a free
"sausage sizzle"

Maybe we will see all the empty floor space filled with
FALCONS real soon now. :)

>
>How many people in their right mind would want to use M-TOS on a 68000?

Me. (Then again, it *is* debateable whether I am in my right mind or not :-). Actually, I'm planning on using it on my MegaSTe4 - if it's nearly as useful to me as MultiGEM, then I'll be satisfied...

>The majority of users have ST's, not TT's or Falcons, and on ST's M-TOS
>is just about a waste of time! (Looks real nice but it quite slow to
>say the least).

Probably depends what you're using it for. In a real basic way, it could be used simply as a task switcher - i.e. no need to exit out of one program to access the rest. Things start slowing down when you start letting things *process* in the background (i.e. disk formats, zmodem transfers, etc). Of course, this may hinge on whether you're the casual user, or the power user (at work, I usually like to keep about 4 programs running under Windows 3.1 (usually at least 2 DOS boxes) - slows things down, but is very convenient for me at times)...

>Beginning users are usually put off by CLI's, with a GUI they don't
>have to remember much, just click on what they want, and it appears.
>CLI's a far too slow for my purposes, I like to have lot's of RAM available,
>and quick access to what I wan't without having to CD to directories
>etc. The majority of users on this net seem to be against GUI's, but
>the majority of ST-Users out there are not!

Again, it depends. If users were totally put off by CLI's, PC/clones would probably not have gotten popular. The addition of Windows to the PC-land no doubt has helped sell more machines, for the reasons you mentioned ("just click on it and go..."). I set up the PC at my parents house with a simple GUI (read: program launcher) to simplify things for them - of course the most they may use it for is basic applications such as word processing, etc. Of course, though GUI's are easy to use, you still need someone to *set it up* which is not always a treat...

The best solution (in my opinion) is to perhaps set up the GUI like the Gemini desktop (is the author still accepting registrations, btw?) - that is, have the GUI as the default, but have a CLI built-in to the GUI. That way, you could have the convenience and simplicity of using the GUI, as well as the power and flexibility of using the CLI. A reasonable compromise between the two camps, I'd think...

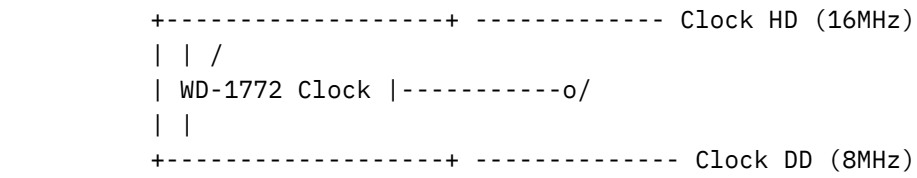
> A while ago there were some articles on adding a HD floppy to a MEGA STE.
> I would like to add a HD floppy to a standard ST. I have an WD-1772-02-02
> controller chip available. What else would be needed?.

Same as for a Mega...

- At least TOS 1.04 (? I'm not sure if it works already with TOS 1.0 or 1.02)
- HD drive (of course!)
- Some electronics to switch 8/16MHz Clock on the WD-1772, depending of which
type of disk is in your drive
- Software to adjust the steprate for HD use..

Principle:



The position of the electronic switch can depend of parameters like:

- HD signal (from the floppy drive)
- Drive select signal (if you operate with two drives i.e. 1 DD & 1 HD)

Hope this helps.

5634. Announcement-- Demo of Edith, the Desktop Text Editress

Newsgroup: comp.sys.atari.st
Date: 1993-04-19 13:42:50 UTC
From: avgroeni@cs.ruu.nl
Message-ID: <1993Apr19.134250.27928@cs.ruu.nl>
Source record: 207214

I uploaded a (quite old) pre-release of the text editress Edith to the Editors folder of atari.archive.umich.edu. It is an outdated version of the commercial editor we hope to present at the Atari Messe in August of this year. Edith is to become the Tempus of the Falcon era. For a list of features see the archive, which also tells you what will be added in the commercial version. The version on the net is shareware (25 DM). People who have registered for the shareware version will get a 25DM discount for the first commercial version.

Try it. It will work on all systems including 320x200 screens or MultiTOS (although support for the latter is still being worked on), and supports a lot of options one simply misses in editors available at present. Test it, use it (I should be saying 'her' here, sorry), and let me know what you think, and even more important: tell me what you'd like to see!

Thank you.

|> Is there any public program that is similar to SPICE ?

SPICE is a public (domain) program itself (from the university of Berkeley). A version for the ST is available via ftp from u.e.a.a. (and probably others as well). I haven't really tried this ST-version, just looked at it. It might be somewhat outdated. Some comercial software companies have made a more userfriendly interface to the SPICE simulator. But I have never seen any of those for the ST.

5640. Atari 30MB HD for sale

Newsgroup: comp.sys.atari.st
Date: 1993-04-19 15:15:20 UTC
From: dmeggins@aix1.uottawa.ca
Message-ID: <1993Apr19.151520.23876@csi.uottawa.ca>
Source record: 207223
Cross-posted to: misc.forsale,ont.forsale,tor.forsale,ott.forsale,comp.sys.atari.st

I have an Atari Megafile 30 hard drive for sale: 3 years old, works dependably. This is not a blindingly fast HD, but if you need a little more space, it is quite fast enough even for Calamus. I have sold my Atari system, and no longer need it.

Price: CAN$200 or best reasonable offer -- shipping to be negotiated. (I am open to offers, so don't be shy!)

5641. Atari posts large loss (again)

Newsgroup: comp.sys.atari.st
Date: 1993-04-19 15:17:05 UTC
From: mauritz_c@spcvxb.spc.edu
Message-ID: <1993Apr19.111705.5679@spcvxb.spc.edu>
Source record: 207226

FYI...Atari is trading at $0.50/share right now...it doesn't look
very hopeful, especially in light of the following...

------------snip snip-------------------

04/19 (WJ) Atari Corp. Said Wider Net Loss Posted For the 4th Qtr

Atari Corp. said its fourth-quarter net loss widened to $21.9
million, reflecting charges related to operational restructuring and
inventory.
Net loss for the maker of video games and personal computers, equal
to 38 cents a share, compares with $4.4 million, or eight cents a share,
a year ago. Sales plunged 73% to $25.6 million from $96.1 million.
The results include charges of $7.4 million for restructuring and
$14.1 million for inventory write-downs.
For the full year 1992, the company in Sunnyvale, Calif., posted a
net loss of $73.6 million, or $1.28 a share, vs. net income of $25.6
million, or 44 cents a share, in 1991. Annual sales were $127.3 million,
down 51% from $260.0 million.

5642. Atari Minix for sale

Newsgroup: comp.sys.atari.st
Date: 1993-04-19 15:17:16 UTC
From: dmeggins@aix1.uottawa.ca
Message-ID: <1993Apr19.151716.24023@csi.uottawa.ca>
Source record: 207224
Cross-posted to: misc.forsale,ont.forsale,tor.forsale,ott.forsale,comp.sys.atari.st

Prentice Hall Minix 1.5 for sale, including manual and all original disks.
This is a Unix V7 clone which will run even on a 1040 ST with a simple
m68K processor. There is an active newsgroups, comp.os.linux, which
discusses this OS (also available on PC, Amiga, Mac, and Sun Sparcstations).
Retail is around $150, but I cannot remember the exact price.

The system includes full source code for the OS _and_ for most of the
ca. 175 utilities which come with it. MiNT can use Minix partitions,
so the two OSs will co-exist quite nicely.

PRICE: $50 -- shipping to be negotiated.

Sorry I got the ftp site wrong in this posting. The correct abbrevation is a.a.u.e and the full name is atari.archive.umich.edu (as you probably know).

5645. Upload: GDB 3.6 for Atari w/ MiNT

Newsgroup: comp.sys.atari.st
Date: 1993-04-19 16:46:00 UTC
From: schwab@issan.informatik.uni-dortmund.de
Message-ID: <SCHWAB.93Apr19164600@issan.informatik.uni-dortmund.de>
Source record: 207221

I have just uploaded a port of gdb 3.6 for Atari w/ MiNT (source only)
to ftp.germany.eu.net (192.76.144.75), soon to be available in
pub/comp/atari-st/mint/gdb36s.zoo. It will only work with MiNT 0.98 or
newer, and has all features included except core files and remote
debugging.

This version has improved C++ support compared to gdb 3.5 (of which i
have posted atari patches to comp.sources.atari.st recently). I have
further improved this to better support GCC 2.x.

The original sources are available in
labrea.stanford.edu:pub/gnu/gdb.xtar.Z (thanks to J.Bammi for pointing
this out)

Enjoy,

Atari stock is back up to 7/8-15/16. I can't wait for
STReport to come out now, because whatever the stock
is at they will claim it is "hovering" at 1/2. I think
Atari will be fine. I think they are going to sell lots
of falcons to musicians, and I think that music retailers
are going to open up a new sales avenue. Is anyone else
as fed up with STReport as I am ? I can't stand how they
leave the same negative remarks in every single issue. If you
can't think up something original you shouldn't be publishing.

Source record: 207232

I just called <<<InterNet>>> in the UK, the European support BBS for FreeZe Dried Software, because I wanted to know whether or not there is ever going to be another version of FzT.

I went to the support area and it just so happened that somebody had asked the precise question I wanted an answer for, and Sean Price (the guy who wrote FreeZe Dried Protocols) had answered to him. He said that he had talked to Aaron for about 3 weeks ago now, and that Aaron was busy doing FzT 3. He said that it was going to be in 100% assembly language, and that it was about 40% ready. He told us to look for it "sometime this summer". Features weren't revealed very much, but I think he said something about fossil drivers for ANSI/VT100/VT52. I don't know what a fossil driver is, even if I have heard of them, maybe somebody wants to tell me about them?

Oh, and for the guys that think Aaron is a cheater and doesn't send anything for the registration fee, I can only say that I at least got my key after paying, very quickly. I registered via Ben Van Bokkem, the SysOp of <<<InterNet>>>.

There is a nice version of zoo where you can simply say 'zoo ah//
zoofile directory', and zoo recursively packs everything in that
directory. I think it is one of the first versions which were ported to
the ST using gcc.

I can highly recommend zoo, as I have had the fewest problems when
transfering files between SUNs, PCs and my Atari ST when using zoo -
opposed to, e.g., lharc.

Hm - atari.archive and many other sites I know use zoo for big parts of
the archive, eg. most of the GNU stuff. Could you name some of those BBS
sites ? what's the problem using zoo ?

s>Its nar imposible to redirect the out put..

As zoo is compiled with gcc, it uses the normal standard output and
standard error channel for messages, which can be redirected as easy as
any other gcc compiled program can be. If you are having problems, you
should check if the problem is caused by the shell you use.

s>I think sticking to LZH201L or the New STZIP 2.2 will be far better,these
s>do work on small 520k one drive ST's...

Don't recommend lharc - there are much too many incompatible versions
around - I use zoo with no problems to exchange files between SUN, PC
and ST, which does not work as well using lharc (the new versions are
better, but you don't know what version other people have, and try to
get a lharc-2 on a sun).

STZIP 2.2 is fine - high speed, good compression. There is a bug in the
dialog handling, but that does not disturb if you call it via command-
line, plus it has a comfortable menu-driven interface build-in.

I use STZIP to pack most program archives where I am sure that I will
only need them on the ST, and zoo otherwise.

s>Take it from some one thats tried them all....
Me, too - and I can't understand why anyone should have problems using
zoo.

There are some interfaces for the ST like SPICELINE... it is from Germany
and there is a demo on the archive at UMICH... it is wonderful!! I wish
the man who programmed it though would post how much the thing costs in US
dollars thpugh :(.
There was something else too, a graphical program that you use to set up
the circuits so that you do not have to write a text file... I have been
using SPICE on my TT and it is very fast, although I am not sure that it
uses the mathcoprocessor (probably not).

>run applications, not to run an operating system)

If NeXTStep 486 is priced like it is stated today (US$995 for user, close to
$3,000 for Developer Version) it will not succeed. Furthermore, the NeXT
machines have designated processor for virtually everything. The Atari
or the PC are not designed for it. I have tried NeXTStep 486 at a
local show on a 16 Meg 66 MHz PC and it is slow compared to, for example,
OS/2 2.X. It is nice but so is OS/2 2.X. If you need 24-Bit color, NeXTStep
486 requires 32 Meg of RAM, which is to much for most.

BTW, the April issue of "Computer Paper" reviews several operating systems
including System 7.1, OS/2 2.1, Windows 3.1, Windows NT and MultiTOS 4.0.
They have a nice chart comparing all those operating system. The magazine
is only available in Canada, and this issue is the Ontario Edition.

Best Regards,
Mark K.

Sure, they can be separated, it is quite possible to pirate software without phreaking, and vice versa, but let's be blunt, shall we - virtually all serious piracy is done through phone phreaking. Serious pirates call overseas or cross country in such volumes and frequently enough that they couldn't possibly afford the long distance charges. Scary but true. This is based on my limited observation of a couple pirate boards many years ago, I imagine it's only worse today, what with the high-speed modems.

Not difficult for the 386 to do so, since VGA cards have a real text mode and
Atari machines don't.

>direct proportion to how much output is being dealt with. The 386/25 can
>scroll text hundreds, of times faster than the Falcon. It can move pixels
>around dozens of times faster.

No, the DOS machine can't (at least not with any VGA card). Reason #1: The ISA
bus limits data transfer to approx. 1.4 MB per second. Reason #2: The Falcon
comes with a BLiTTER chip _and_ its CPU/BLiTTER->RAM bus is twice as fast.

These two also lock up on Mega STEs and STs w/ accelerator boards. The problem
isn't in the machine, but in the CPU-speed-dependant key check algorithm C-lab
used.

On Mega STEs, one could "fix" it by switching to 8 MHz before loading C-lab
stuff and flipping back to 16 after that.

On tuned STs and Falcon030, no go :-(

Actually I think you'll find Photochrome is up to v3.01 now...

Yes, it is the way all GIF viewrs should go.

SPOFLITE is good too, but photochrome gives better results....

Karl.

Not really... I'm so bloody sick of scrollbars. And there isn't a
single demo that I've found that will work on my system (mutant 4M, high
density floppy).

That's gotta be the funniest thing I've heard all day. Actually, it
kinda ticks me off.

HOW can you possibly claim ATARI screwed up? You took what is
essentially a souped-up text filter (hey, the character-only version
worked fine on everything, no?), and made it incompatible with
everything by screwing up on your attempts to graft a GUI onto it.
IMHO, some serious programming errors went into this application.

Not that I'm saying Atari has never screwed up (or isn't right at this
minute), I just think the blame should go where it belongs.

--
I recently installed a drive for a friend. I replaced the single sided drive with a double sided drive. I got a Teac 1.44m drive for $55. I had to set the jumpers for 720k instead of 1.44m, but it was easy to do. I also had to replace the ribbon cable to get enough length to be able to reach. The connections are opposite (nearly) to the Atari, so I had to turn the cable over and put on a new pin connector. [Actually, I took out the old ribbon cable and put the new ribbon cable on the old board.] I got the pin info from a file called IBMDRIVE.LZH on the Umich Atari archive site.

Good Luck!

NeXTstep '486 _will_ take off, even if 1% of the '486 owners use it.
Chrysler's already committed to buying NeXTstep '486 for all of its PCs.

If you'd seen NeXTstep, maybe you'd buy a computer to run it... it's
that amazing. Oh, and you can run FrameMaker on it. <drool>

Unbearably slow on an ST (it takes a LONG time just to move one square)
and incredibly red (I'm not sure why... _all_ of the graphics have this
gross red tinge).

The opening animation is embarassingly slow.

Games have outgrown the ST.

I myself would appreciate it if you dodn't lump us all into the "them" category. I myself hope Atari continues to survive. I use an Amiga, but the last thing the computer industry needs now is less competiton. We already have some mighty huge conglomerates (Microslough and Imtwill come to mind, since Immense Bowel Movements is in big toruble) that need trimming, and I'm as tired of anybody of their attitude. IF you don't have a 786 with ten bajillion meg or fam, WINDOZE 5.9999 and so on, they won't give you the time of day.

So give me a break! I never posted anything nasty in your area here.

GBench
Thanks for your help.

I will bimail you all with another test version of GBench in the next
few days.

There are a few changes - hopefully you will always get 100%
on a bare system, although the Falcon stats are a bit of a problem
because there are too many ROM and RAM versions around. I am hoping
to base the stats on TOS 4.02.

There is also a new test for justified text and some tests have been
doubled in time because they got too short on TTs to be accurate.

To save you all time, I simply need binmail of two tests from each
system.

If you have an ST, MegaST or STE -

1. Without blitter in monochrome at 8MHz
2. With blitter in monochrome at 8MHz

If you have a MegaSTE -

Same as above in 16MHz with cache on

If you have a TT -

1. In fastram - ST high res
2. In ST ram - ST high res

If you have a Falcon -

1. One test in monochrome res

ALL TESTS SHOULD BE DONE ON A BARE SYSTEM - no auto programs, no DAs.

==========

Thanks very much for your help - which will of course be noted
in the read_me file.

I'm using a NE* Multsync GS. I think that's the monochrom model you mean.
I've bought my switchbox with the monitor, so I can't tell you wich
connectin have to be made. But I think this switchbox should be sold in
every Atari store.I payd 15 german merks for it. Tht's not very expensive
I think.

Hatari!

_FDC is the cookie for the CloppyDiskController. The highest byte contents the kind of disk that can be used, such as $01 = HD-Disks, $02=ED-Disks. Notice: This byte just says, what kind of disks the controller handles, there has not necessarily to be such a drive/disk in the computer!

Greetings - Roland

I have used Speed of Lite on the Falcon and it only uses 256 colour mode
and does not use the dsp. Like many programs it works on the Falcon
but really does not make much use of it. True Paint however loads JPEG's
using the DSP so it is *very* fast (so I am told!).

I hope to get it very soon and try it out.

>necessarily to be such a drive/disk in the computer!

Hmm, this is not completely correct. The cookie value indicates what kind of
disks TOS is able to format. Normally you find the value $01, i.e. the BIOS
flopfmt() call is able to format HD disks and protobt() is able to create a
BPB prototype for HD disks. So you may have an ED controller (e.g. AJAX)
installed and the cookie still signals HD.
Keep in mind that the cookie only tells you about some BIOS or XBIOS
capabilities. If you use BIOS independent software to format disks and have
an ED controller and drive installed the _FDC cookie isn't that important.
Nevertheless the cookie should only be installed on machines that use a
fully TT/Falcon compatible way to change the FDCs clock frequency. There are
some programs that rely on the cookie when checking how to switch between
DD/HD/ED mode.

I hope this was complete and correct so far.

That is a bogus analogy. Ferraris and Hyundais use the same fuel
(more or less). Ferrari doesn't have to cajole a petrol company
to make special fuel for their cars so in effect they can
only worry about "hardware development" and forget about the
"software".

With computers, not only do you have to invent a good platform,
but you have to convince developers to write software for it.
In order for developers to be convinced that they can get any
return on their time investment, they have to be convinced that
there are enough units in circulation with an "ownerbase" willing
to purchase the product. As the number of units shipped gets
larger, this task gets much easier.

Atari is in a bad spot in that they don't have the machines
out there AND they only seem to have a tiny amount of Falcon
specific software out there.

Hell, Atari actually SOLD the STe's for how long and there
are (at best) only a few software titles that take advantage
of its features.

Cheers,

Chris

Gee, what a pithy comment. Yeah, him and most of the other people in
the world. It makes it difficult to "see a Falcon" if Atari keeps
hiding them. Sheesh...

I've now got my second Falcon, the first died a death about a month ago, and Atari replaced it with a new machine. The old machine was one of the R3 machines with TOS4.01 in it. The new machine has 4.02 in it with a date of Jan 1993. This is probably a good guide to which machine is which.

Since you only have a 520st you cannot run LaTeX, which would be
perfect otherwise. I suggest you use a wordprocessor that can use GDOS
fonts, and use a fonts that has these characters, or create such a font
yourself. It is easy, using Gemfed or Fontz!.

I have had my falcon for about a month now and would like to ask fellow users a few questions about the s/w packaged with it in (UK bundle).

Fiestly, does anyone have the SAM package and if so, is it PD so you could send it to me?

Does Control Panel's General CPX have facilities for turning off Caching because it says so in the manual, but I cannot find it on there. I have a blank space on it which i guess is where it might well go. Maybe I have an early version? anybody?

Thanks

5697. How to upgrade a 7 year old STf

Newsgroup: comp.sys.atari.st
Date: 1993-04-20 13:00:54 UTC
From: craig@hadrian.uk.sun.com
Message-ID: <1r0s66INNpto@uk-news.uk.sun.com>
Source record: 207370

Well I finally got there, thanks to everyone who has helped me with this so far. I have been upgrading my 1040STf for the past 6 months and here is what I've ended up with.
Two STf cases, one sawn in half and glued to the back of my existing STf case and then the CPU board slid into this new open area leaving the keyboard on it's own. This allowed me to stack add-on's on top of the CPU (TOS 2.06 and Vortex AT-Once).

The machine still looks like an STf with it's covers on, but a bit like a MEGA ST.

The TOS version is switchable between TOS 1.0 and 2.06 for compatibility, but I would like to get TOS 1.4 for it really.

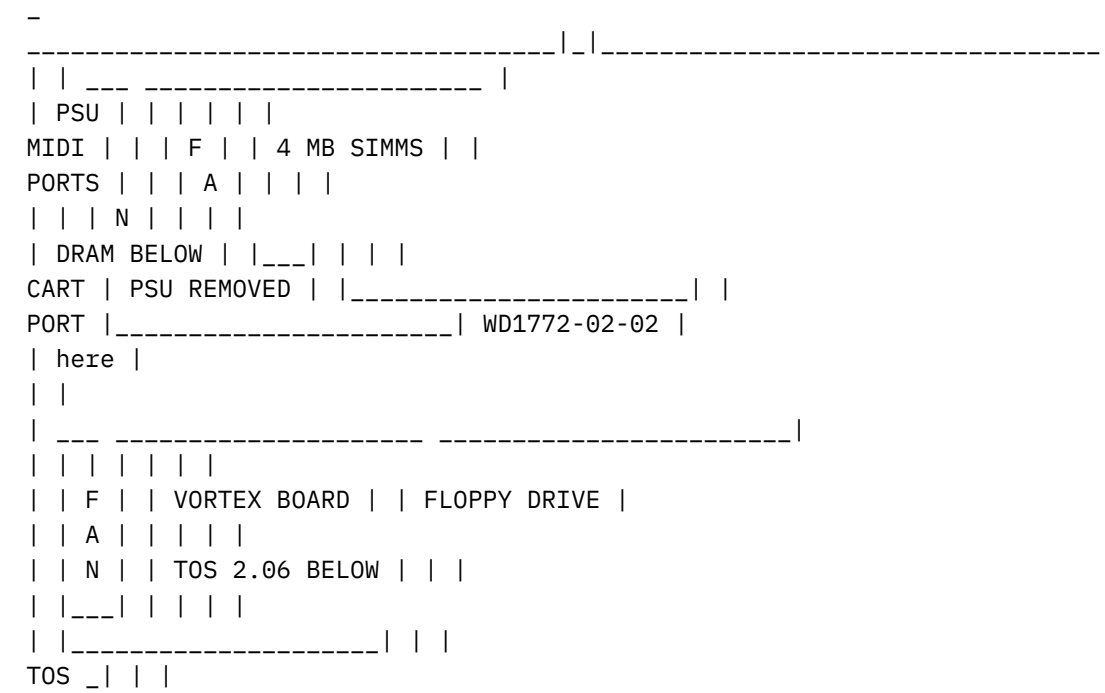
Removing all the metal casing enabled me to fit the Memory expansion (4mb) in as well and two fans for cooling. Also I removed the original 1mb of D-RAM that drained the PSU so heavily.

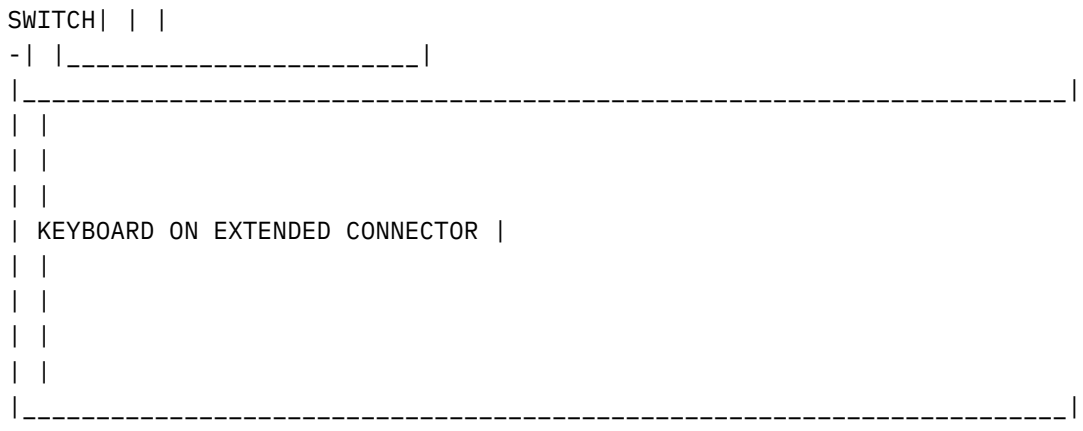
The disk drive was moved forward into the second case for easier access on my desktop and a fan grill fitted over the old. The floppy controller has been upgraded to a WD1772-02-02 and I have a switch for clock speeds so I can use a 1.44MB B: disk for DOS WINDOWS etc. I also have 400mb of disk and a 150mb tape drive on this little beauty.

Any Idea's what to call it?

ATARI 4096 STf 386-SX ?

So it looks a bit like this....
8/16 Mhz switch





SWITCH
KEYBOARD ON EXTENDED CONNECTOR

Source record: 207384

Atari 1040 STf, TOS 1.0 (compatible with ALL shareware) $250

comes with WordPerfect; MagicSac+ and Spectre128

Macintosh emulators (64k roms only); pd, mag, demo software; a few

games; reference magazine library (the best; Current Notes!);

and MIDI cables. Unit has been covered and surge-protected since

birth. All ports have been tested (I was an ST salesperson).

Magnavox 8cm515 color monitor w/ custom ST cable. $250

Better than Atari! Usable as CGA or analog-rgb monitor with other

computers; as a hi-res tv with a vcr (better picture than any

regular tv); larger (14" vs. 13"); better made (Magnavox

vs. Samsung/Goldstar); separate sound jack (hook sound to stereo!

Atari SM124 mono monitor (only for sale WITH computer) $125

Better than normal; modified to use almost full screen (only

1/2" border) yet VERY sharp; brighter than new SM147's (and has

sound); better made (Goldstar vs. Samsung/whoever)

All units covered and surge-protected since birth.

Lauren Howard lch3e@virginia.edu

Newsgroup: comp.sys.atari.st
Date: 1993-04-20 14:58:36 UTC
From: cwood@gst-soft.demon.co.uk
Message-ID: <1993Apr20.155836.1@gst-soft.demon.co.uk>
Source record: 207380

Both viewers are excellent except they both have one very annoying
feature each! Spoflite usese the Global Image size when displaying th
eimage, rather than the local image size, which has a tendancy to
make the quality worse. Pchrome on the other always expands a GIF
smaller than 320x200 to 320x200 wich stretches the image. so a
120x200 image looks awful.

These problems means I can't use ImagePals on my PC at work to play
with GIF's without using another program to just read and re-write
them......aarrggghhh. Mind you there still a damn sight better than
what I could do, so I can't really complain.!!!!!

>
>Please, if anyone has _any_ suggestions, post them!

You might try asking on one of the comp.sys.ibm.* echos (the best one may be comp.sys.ibm.pc.hardware). I say this because the conversion seems more geared toward a PC user wanting to use that monitor, than an Atari user who already can use the monitor (unless maybe they want to really go wild - converting the monitor to VGA, then using it as a VGA monitor with a Falcon :-)

As for graphics cards, assuming that the Atari monitor can be modified/adapted to handle VGA signals, you should probably be able to use any VGA card (at least with a res around 640x400). I haven't tried this, but that would be my guess...

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...you might want to price mono VGA monitors anyways - it may be cheaper to go that route than to do the conversion; besides, with the Falcon and beyond, VGA/SVGA/multisync monitors will probably be the way to go...

> the latest version of Mac Software and make it work on an older version. Only
> vice versa.

Er, MS Word 5.0 is working just fine with my Spectre 128. Am I just lucky?
Is there a disaster here waiting to happen? BTW, Word 4 can read Word 5 files.

> In fact, try going to a Mac dealer and purchasing
> sytem 6.5 or 6.4 system/finder. YOU CAN'T! They don't sell them anymore.

Yup, they just give them away. You can even ftp them from ftp.apple.com.
Also, I have yet to run into anything major that does not still support 6.0.x.
On the other hand, I am not a big Mac person, just a dabbler. For this, the
Spectre products are excellent. IMHO, a Mac plus (or clone or emulator) has
these pros and cons:

Pro: Lots of mature professional applications, WP, DB, DTP, etc.
Pro: Continued support of these products.
Pro: Very consistant user interface, common to most any program

Con: Slow (but a plodding determined kind of slow).
Con: User interface is idiot proof to the point of irritation in some cases.
Con: All the games suck :-)

I use my ST as an ST most of the time, but having the Mac sitting there if
I need it is really nice. I find Spectre to be rock solid.

I do not intend for this to be a flame. Hopefully the information above will
help you make better use your Spectre.

Quick question: Anybody out there gotten a terminal program (in Spectre) to
work correctly at 19,200 baud? Zterm does not seem to be able to hack it. I
am not sure if it is the program or the ST serial port. I much prefer Uniterm
in the ST environment anyway, but it would be nice to have one on the Mac for
an occasional login.

>>at a price not much higher than adding these pieces separately to my 1040.
>>Then of course I *also* get a processor thats a heckuva lot faster.
>And even more wins: a battery backed up clock! More colors! An extra
>serial port! Double the diskdrive space! So, about everything, one
>would like to add to a 1040 :)

>Erlend.

Nonetheless, you might want to consider getting the 14/65
configuration. With MTOS loaded, 4 Meg's are very little. Since
upgrading the Falcon always means replacing the entire old memory and
getting a new memory board, it might be a good idea, to get 14Meg's in
the first place. BTW 14 Meg's is yet another thing you cannot have
with your old 1040 :-) ... and it is *really* convenient.

So long,

Markus

>Spectrum Tape Loader... plug tape recorder to ST like this...

Thanks a lot for posting the Tape Loader (No irony marking smileys, I really mean it!). However, after having fooled around with a few ftp-able assemblers I must admit that I do not know enough (i.e. virtually nothing) about assembly code or assemblers to get it to work.
Would it be very problematic to post the binary as well? I have an 8 mHz ST, so that should work alright.

Thanks,
Hendrik Jan Bosman

I would hope that the program is easy enough to use/learn without having to reach for the manual, if possible. Something like online help screens is what I personally prefer. Besides, I look at the manual as a last resort (and I'll not just look at it, but actually open it up if I'm really desperate! :-)

Not necessarily so. I've seen adds for a Falcon030 RAM board that can hold either 4 or 14 megs of ZIP RAM. (All of a sudden, the sound of a thousand 1 meg Falcon030's is heard).

About the only programs I've run across (admittedly, not many) that
seem to not want to work with Spectre are those requiring *color*
MACs. Of course, the same problem may happen on a regular Mac Plus
(or non-color Mac). BTW there's always the nice TSR's that sometimes
help with some programs - one to emulate a 68020, and I believe another
to emulate a FPU, both in Mac mode...

The one thing I have not figured out yet is how to convert those
Image files into a disk - if you've done it, can you tell me which program(s)
you used, etc?

>On the other hand, I am not a big Mac person, just a dabbler. For this, the
>Spectre products are excellent.

>an occasional login.

I've used Zterm at the 19200 setting (to be honest, I'm not
sure if the call was connected at 9600 or 19200 - high speed modem settings
are a bit confusing). Anyways, it's seemed to work okay for me
(nice to see a Mac program with *zmodem* anyways). Of course, I'm on
a MegaSTe, so I don't know if the increased CPU speed has anything to
do with that or not...

Now if there were only a Mac terminal that would take advantage of
my MegaSte's extra serial ports - would like to kick it up to 38400baud :-)

Oh, quick plug - check out Connect 1.96 (in ST mode) - has an
interface similar to that of Zterm (and all the goodies of Uniterm...)

Much as I would like to claim my TruePaint JPEG loader uses the DSP, I'm afraid honesty prevails! As yet I haven't got DSP-based IDCT working, though the CPU-based IDCT isn't bad (minimized multiplies based on the IJG code).

Half the problem is I could do with someone inventing time travel :-)

But there's a difference between multitasking and Multifinder. Multifinder is indeed quite useful, but it is NOT multitasking--it's only running whatever's in the selected window. Everything else is just sitting there--which is fine, being as a drawing program or whatever doesn't have much to do if I'm not telling it to do something.

>better, but you don't know what version other people have, and try to
>get a lharc-2 on a sun).

When are you going to open your eyes ????
lharc-2 is known as LHA under unix and IS available (it's even at
atari.archive.umich.edu:.../Archivers/Unix/lha-1.00.tar.Z)

I know lharc is not perfect and has some incompatibilities,
but it is available on most platforms, even version 2 !

Well, I have TONS of GIF's, and still no decent GIF viewer! I am still trying to figure out this whole USEnet thing so I can get Speed Of Light, which is susposed to be pretty good. To whoever it was that sent me mail a while back, asking for my usenet address, sorry I did'nt reply, but whenever I reply in Internet it does'nt work, says something about invalid address or something like that. So here's my request (beg?) Could someone PLEASE put Speed Of Light on the Atari.Comp.Sys.Binary? And then tell me, someone who knows absolutely NOTHING about how this works how to get it into a file? Someone mentioned uuencode command or something, but that did'nt seem to want to work....any help would be greatly appreciated.

I've been using ACSII transfers and capture buffers for a while and
I'm fed up of the time it takes to UL or DL stuff. I have a few Term
programs (inc . CoNnect which I hope to register this week) but I'd
really appreciate advice on how to set up my modem to use decent protocals
I have a 2400 modem and it's used to logon on to a decstation at a local
server prompt. From there I can connect to any of the available systems.
(like unix or vms) . The setup for connection is 2400 8 bit 1 stop bit
full duplex. I don't know about XTS etc. so this is where i'm looking
advice.
Any help on the matter would be appreciated.

Sean.

5736. Sharable TCSH

Newsgroup: comp.sys.atari.st
Date: 1993-04-21 05:41:56 UTC
From: dud@stein.u.washington.edu
Message-ID: <1r2mr4INNsb9@shelley.u.washington.edu>
Source record: 207113

I'm having a problem with the new sharable version of TCSH in that it can't seem to find my login.csh file (in the /etc folder). I tried renaming it to .login, I tried putting it in the /bin folder with TCSH, I tried putting it in my home directory, but nothing will work. When I run TCSH, the prompt is just a # and none of my env. variables are set. I have to type "source /etc/login.csh" and then it will do it fine. (My login.csh has a "source ~/tcsh.rc" in it). The old version of TCSH did not have this problem. Anyone have a clue what's wrong?

Thanks for any enlightenment...

Hey Mr. Raist..Apple posted a profit of $110 million in profits, but were below from thesame quarter last year...Revenus were up by $250 million...

The cyclones will be out soon...Probably before the Falcon...I bet Cyclone sales alone will be higher than the Falcon...Apple will be able to crank them out of their factories...

>I use poolfix and pinhead which need to go first.
Pinhead2.1 does not need to go first as far as I know. It is just that
booting will be a little bit slower if AUTO MON is loaded without the
fastloadbit set. For poolfix I don't know, maybe you should use a
patched german version of poolfix that uses XBRA correctly, but then I
am not sure if AMON will use XBRA.

>Would you explain to me what is the difference between 1040 STF and 1040 STE?

Oh yes, and one thing that the other poster forgot to mention, the STE
has a color palette of 4096 colors instead of just 512 colors.
It also has hardware scrolling (a big plus if you like demos!).
Also it has some functions integrated in one chip, so the overscan
modification will not work. And the tos version in it (1.62) has a
cookie-jar.

Erlend.

Well why not buy STeno, the desk accesory. I heard it is a nice editor,
and it can interface with STalker too if you need it. It should also
run as a program. Maybe someone else can tell you more about it.
I know it is not expensive. I think 15 UK pounds or so.

Erlend.

5743. Current UK Falcon Prices (Retail and Developers') - Anybody know ?

Newsgroup: comp.sys.atari.st
Date: 1993-04-21 08:54:25 UTC
From: sms@sys.uea.ac.uk
Message-ID: <sms.735382465@radon.sys.uea.ac.uk>
Source record: 207124

As the subject says, does anybody know the current UK prices of the various Falcon machines. As far as I know the prices have just gone up to 599 for the 1MB/0HD version and 999 for the 4MB/65HD version. Personally I'm interested in the big 14MB one... anybody know the price?

Other than UK prices would be useful too, as long as all the prices are given, as I would imagine the ratios between the prices will be the same.

Also, I'm very seriously considering registering with Atari as a Tier 2 (or whatever the non-professional level is now called) developer. Is the 25% discount for developers I heard about valid for that? I may be getting more than 1 Falcon eventually so it will definitely be worth it in the long run...

- Steve Sowerby, Postgraduate Layabout (sms@sys.uea.ac.uk)
- School of Information Systems, University of East Anglia, Norwich, England.
- # The above opinions do not in any way represent the University. Most
- people here wouldn't notice an Atari unless it was disguised as a Mac #

Sorry Mark, but I have to correct you on this one. TOS is at version
4.0x but MultiTOS is at the moment at version 1.01 and Atari probably
has more advanced versions already. But of course I don't know that.
Maybe they are first waiting a bit more for user impressions of
MultiTOS and are now working on more drivers. Who knows.

Well I am just guessing at this. I used to have similar troubles, but
not anymore, now I have upgraded to TOS 1.4 and am using another
formatting program (that last one is probably the reason I have no more
problems).
I think the problem is that disks all have the same serial numbercaused
by the formatting program you use. It needs to be a random number,
otherwise the computer will not even see that it is a new disk that is
inserted. Oh yes, newer TOS versions also have better checking for when
disks are changed.

NOT !!!!!!! I have seen it, and it does not yet use the dsp for jpeg
loading, but hopefully later versions will.

5747. New on a.a: SQUARE OFF arcade/maze game

Newsgroup: comp.sys.atari.st
Date: 1993-04-21 10:10:40 UTC
From: evilandi@vnet.IBM.COM
Message-ID: <19930421.022342.438@almaden.ibm.com>
Source record: 207125

My game SQUARE OFF is now on atari.archive. To get it, send an email to
<atari@atari.archive.umich.edu> with the first line of the message reading:

send Games/squaroff.zoo

The game takes up just under 100k uuencoded. Requires COLOUR ST/STe.

Square Off originally appeared on a coverdisk of Atari ST Review mag in the
UK last year, but is now PD. The object is to traverse a maze of squares,
picking up points on the way. Different squares have different effects; eg.
one-way, teleport, disappearing, monster release and even some firepower!
There are 50 levels and the game includes speech synthesis to talk you through
the game with a few helpful/derisory comments.

Sadly I cannot post this to the binaries newsgroup myself, so if someone
would like to volunteer to do it for me, please email me first. Also, please
upload this game everywhere. Thanks.

A souped-up version including tracker music, sampled sound effects and a
very comprehensive level editor is available on the Budgie UK Licenceware
label at most UK PD libraries.

Haven't seen 'Armada is dead', but the Grotesque demo is excellent - and it works on my Falcon as well (if you have the STE sound driver loaded first).

Oh yes - the CEBIT93 Falcon Demo - did it REALLY need the ten minutes of (ok, very pretty) topless girl at the end ? It embaressed my girlfriend no end :) Never mind - the DSP text rotation at the start is very nice.....

>You are not on the scene, are you? It's true that many groups have left the
>scene, but not everyone. The best groups still continue on ST(e).

I haven't seen any of the new STe demos (I only have a ST), but the
ST-demos released within a year or so have been lousy or just average.
Originality has seemingly died. If the 'best' groups can only produce
'listen-to-this-new-digi-shit'- or 'hey-I-can-do-this-too'-demos
what is the future or will there be future at all?

>Almost anything that can be done on Amiga, can also be done on STe
>(and we will prove it and do even more...)

What is the point in proving that you can do the same with STe than
with Amiga? People should do real, original demos, not some lame
Amiga-imitations which show that you can do this on Atari too (90% of
the Amiga-imitations are worse than the original).

Can anyone tell me how to click on 'extract all the zoo archives I've
selected, each one into a separate folder' in any GUI? (You could do
it double-clicking on a shell script in Gemini... but who is to write
that script?)

>CLI's a far too slow for my purposes, I like to have lot's of RAM available,
>and quick access to what I wan't without having to CD to directories
>etc. The majority of users on this net seem to be against GUI's, but
>the majority of ST-Users out there are not!

You obviously have never used a good shell for longer than it takes to
crash a clone. The trouble that GUI fanatics seem to be having is,
that to be able to use a shell to one's advantage, a little learning,
understanding and appreciating (hey, I sound like the perl book here)
of certain ideas and concepts is necessary.

I am _not_ against GUIs. I like them, I use them. But I would never
want to live without an additional shell. The point is that GUIs only
do well what they are programmed to do, a shell, however, is much more
flexible (redirection, pipes, shell/env variables, shellscripts, etc.)
and can do what _I_ want it to do, even things the original programmer
never had in mind when he wrote the thing (incidentally, this is the
way of all good software).

5752. WANTED: Suggestions for Desktop program features...

Newsgroup: comp.sys.atari.st
Date: 1993-04-21 11:40:01 UTC
From: sms@sys.uea.ac.uk
Message-ID: <sms.735392401@radon.sys.uea.ac.uk>
Source record: 207132

As you may or may not know I am currently writing a MiNT-using replacement Desktop program. A very early version is currently under testing and I am looking for suggestions of extra features to be added. I already have lots of bits to add but I would still like more. This will also help me to gauge which kind of features most people would like and so which bits I should definitely implement. I'm not going to give a list of current or future features as I would prefer a straight off the cuff list from as many people as possible. Any other comments and discussion of my program is welcome by EMAIL.

One specific area where I need some ideas is in how to implement features such as piping and redirection without a command line... I have some ideas but I'd like to hear yours.

For reference, imagine what features you would add to the existing Atari Desktop if you could... my program is effectively only a clone of that with some extra bits so far (This is getting less and less true by the day, but it still looks like my TT TOS 3.05 Desktop in essence)

Please send all comments, ideas etc via EMAIL
I'll summarize here if I deem it necessary...

BTW, have any of you who asked to test my program actually got it and done so ?
I'm lacking input on it so far. I hope my mail actually got there!!!
(If you haven't replied because you think it's crap, please tell me!!! :-))

- Steve Sowerby, Postgraduate Layabout (sms@sys.uea.ac.uk)
- School of Information Systems, University of East Anglia, Norwich, England.
- # The above opinions do not in any way represent the University. Most
- people here wouldn't notice an Atari unless it was disguised as a Mac #

Source record: 207168

I got mine about a month or so ago and I did not get it then. Mind you I got sod all that was worth anything. I hope Atari update their package because not everyone has access to the pd libs which stock Falco stuff.

Works SHOULD come with a manual IMHO. How can you claim that a GUI program is immediately usable. Take Calamus....its a real nightmare w/out a manual and alot of programs do not offer everything through the menus and stuff, but with keyboard interaction and shortcuts too. How would you know about this. In my opinion shippin it without a manual is very amateurish. Even capappt has a manual.

THE best drawing program for the ST is still I think NEOCHROME!
Yes Neochrome. Even though it doesnt have many of the features of
heavyweights such as Deluxe Paint, it is still the easiest, friendliest
and most fun to use (get the comercial version!). Neochrome also has some
nice hidden features. If you have any version of .9 or higher, just click
with the left(or right?) button with the mouse pointing in the R of GRABBER
and you will get a nice surprise. Degas is another good option especially
since you can draw in all 3 ST resolutions (best in HI rez)

>I can't believe they're shipping a complex program like Works with
>NO MANUAL, let alone no dictionary/thesaurus... Sigh.

>--
I should say here that the dealer told me quite explicitly
that some of the bundled software came without manuals and that they
would be sent to me at no extra cost as soon as they are available.
While it's true that Works is a complex program it is also quite
intuitive to use 'straight out of the box' as any well written GEM
application should be. As I said in the original post, I'd rather
have the software with no manuals than no software at all. The
situation would, of course, be completely different if I was a first
time buyer (Atari has stated that they are aiming the Falcon, at least
in part, at this market), but then hardly anybody in the wider
population knows about the Falcon at this stage anyway. By 'wider
population' I mean people who don't already have an interest in this
sort of computer and non-musicians. The big question really is, will
anybody know about it in the future... and that is largely up to
Atari.
So the point is: the Falcons that have been sold in this
country so far have probably gone to people who already have some
idea of how to put the machine to use and they won't need to rely on
manuals in order to do it. Atari have told me that Falcons won't be
commercially available in Australia untill the end of May, so they
should definately have this sort of thing fixed by then. If, at that
time they are releasing Falcons with 'bits missing' then they risk
alienating new users which would obviously be bad for Atari and
indirectly bad for existing users (I guess that's us).

>I know it is not expensive. I think 15 UK pounds or so.

Newer versions of Edhak (which has "gone commercial") can interface with STalker the same way STeno does. I think there's a copy of EdHak 1.9 at atari.archive.umich.edu that doesn't directly do "big files," but which can work with them in 4K chunks. ("Which 4K chunk do you want to work with?") Somewhat better than Diary2.0S.

You might also want to take a look at the "Edith" editor, recently posted on atari.archive.umich.edu. It runs as either a .prg or as an .acc, and from my initial testing seems pretty good. If you set it up right, it does "fast scrolling" that's similar to that of Sudden View, which is yet another text editor that also runs as a desk accessory.

Interesting. I have some edition of virtually every editor that I've heard of that runs as a DA.

Bob, I downloaded GER2ENG.ZIP from GEnie last night and contrary to other reports I've heard, it ran just fine on my MegaSTe. Has a nice user interface too. Of course, the quality of the resultant translation leaves a LOT to be desired, but it might be OK for some simple translation tasks. Checking the included dictionary, I was amused to see that "anal sex" was one of the terms in the "often used" category. Guess it all depends on what _position_ you take in life, eh? :)

No kidding. That's one of the problems. Bob Brodie says 2-3 weeks in
his latest RTC, which puts the actual Falcon availability date in May.
:(

I don't think I'll be impressed when I do see it. 16Mhz '030 isn't
powerful enough to run the graphics modes the Falcon supports, and
640x480 (even with extra overscan) is pathetic for a multitasking
system.

Is there anyone out there in the vast spaces of the internet that could supply
me with some information about any of the various subjects :-

Font File Formats
Vector File Formats
Raster Graphic Formats
Compression Techniques
Package file formats ... ie Word Processors, Spreadsheets,
Databases.
Gem Resource file formats.

Anything else that would be of interest to a programmer.

Thanks in advance, this time I hope I get some advice and help.

The F030's sound is better, but the LC-3's graphics are better. 1150x860x8
or something like that... a good resolution for multitasking.

Pity the Mac's idea of multitasking is as bad as Windows'.

I'll bet you 80% of programmers feel MUCH more comfortable using a CLI
for development. In fact, I can think of ONE person who uses the GEM
desktop for development... the other folks use a graphical shell like
Pure C/Turbo C's.

And, without programmers, any computer is a useless hunk of plastic and
silicon.

Perhaps we should differentiate here - a drawing package is VECTOR based. A PAINT package deals in pixels.

For pixel painting in ST lo-res there is only one choice - Crack Art (Shareware?).

For Vector Drawing, KANDINSKY CAD is excellent (but in German, sigh) (Shareware).

Commercially paint programs, TruePaint from HiSoft UK is good (it doesn't just work on a Falcon you know), but Chagall from Germany beats it hands down - it's better than Corel Photo-Paint on a PC !!!

>Bob

You might want to take a look at Sudden View... I have a 'student' version
which I paid around $20 for, it runs as a desk accessory, and lets you edit
files up to 75K or so.. However, there ARE the annoying 'study breaks'..

BUT, for another $15 or so you can get the full version.. I think it lets you
specify the size of file you want to edit..

Besides that, it also has some nifty features, like dragging colums, reflowing
paragraphs around words, etc.. If I used my ST more (rather than my PC), I'm
sure I would have gotten to like to like it by now..

> Any help on the matter would be appreciated.

First, you need to acertain what protocols are available on your Unix or VMS systems. Email your sys admin and ask (xmodem, ymodem, zmodem, kermit, etc). I personally like ymodem-batch, lots of folks like zmodem. Anyway, after you find this out and have instructions on how to run the stuff (on the Unix or VMS end), you simply need to do so, then tell your ST terminal program to download that protocol (given, of course, that it can). For example, I use the program "xmodem" on Suns (it also does Ymodem and Ymodem-batch). So, on the Sun, I type:

xmodem sbcykl fname fname fname

(sbcykl = send binary CRC ymodem 1k-packets no-log-file)

Then, on the ST (using Uniterm), I click the "Receive files" button. The modems mutter between themselves for a moment, then start sending packets. After the transfers are done, Uniterm returns me to the terminal, and xmodem exits giving me a regular csh prompt.

The program "xmodem" for Unix is available via anonymous ftp. I would think it has been ported to Ultrix, so you could probably ask your sys admin to install it for you.

You *are* talking about accessories, aren't you? If you have put TOSWIN in the
AUTO folder, that would be a reason for crashing.
Failing that, what else have you got in the AUTO folder?

Jens.

>of some sort; too much raytracing...).

Hm. You would probably still get better performance using the DSP, if you can conveniently work in fixed-point math. The DSP is inherently a faster design than the 68881 or 68882, and in the Falcon the 56001 is clocked at 32 MHz instead of 16 MHz. It would have been nice if there were a jumper on the Falcon to select an external clock for the FPU socket, but as is, it must run at 16 MHz only. (I suppose it would be easy enough to feed a new clock in tho, if you got a faster FPU...)

Just got out of the phone coversation with our local dealer RUN PC, they have just received their first Falcon. (They are unpacking it as I called). SpeedGDOS and MultiTOS comes with it. There maybe some more stuffs as the machine isn't compelete unpack and set-up yet. More to come if I can find some time to swing by there for a quick peek and test fly (cann't drive a bird any more:!).

Well... I DID use GenST, and as I believe I mentioned, there might be a bug,
and since I don't have any Spectrum tapes lying around, it is very hard to
debug it. But okay! Since you ask... I will assemble it tonight and post it
first thing tomorrow morning - after the physics lectures...

>
>I'd like to see anyone work out all the features of Pagestream 2.2 without
>a manual!

I'd like to see all the features of Pagestream 2.2 work. Period. WYSIWYG
my ASS!! Calamus is so much better in the WYSIWYG area it is pitiful! I
timed a process one day and I got a 300k GIF to load and display in Calamus
in as many colors as my system has in _6_ yes count em _6_ seconds...
Pagestream took 2.5 minutes plus... and Pagestream displayed in in 1 color
and pagestream's handles were not on the exact sides of the picture.

I took an ad one day to an imagesetter like this :

::::::::::::::::::::::
::::::::::::::::::::::
::::::::::::::::::::::
:::This was a TIFF:::::
::::::::::::::::::::::
::::::::::::::::::::::
::::::::::::::::::::::
BBBBBBBBBBBBBBBBBBBB
BBBBBBBBBBBBBBBBBBBB
BBBBBBBBBBBBBBBBBBBB <- this was a black box with inverted text
that was supposed to be lined up with the TIFF

I tried every function on Pagestream.. including calling their help line
but I could never get the two to line up... This is ok with 300 DPI but
when you have 3000DPI that extra white space is damn noticeable.
And... (flame on Pagestream continuing) why is it that Softlogic produces
all kinds of cool accessory programs for the Amiga version and not the
ATARI version??? Are markets are approx. the same aren't they?

Anyone feel the same?

(Shareware).
>>Commercially paint programs, TruePaint from HiSoft UK is good (it doesn't
>>just work on a Falcon you know), but Chagall from Germany beats it hands
>>down - it's better than Corel Photo-Paint on a PC !!!

TruePaint has a *very* bad looking interface. I don't know - maybe it looks
good in those weird rez (like ST medium, TT low). Chagall is good - very
good - but they still have to implement some features like for instance text
handling. I spoke to them at CeBIT and they said they waited for Speedo to
go gold before they implemented it. Their interface apparently takes up a
lot of CPU time (I tried their demo on an old Mega4 I recently got my
hands on - my TT's back anytime soon...yippee!!) so I wouldn't use it on
anything below a Falcon. Arabesque Pro should be out soom with a GEM
conforming interface and color support soon, but then again it will probably
not work on screens below 640x400. Arabesque is my b/w favorite, at least
the bitmap part. Look for DA's Picture on the horizon. Their Vector package
is really good and cheap too! Brodie or Rehbock (can't remember which one at
the moment, but I think it was Bill since he was on CeBIT.) raved about it
on one of those RTC's recently. He apparently thought it had better
presentation capabilities than Macromind Direcor on the Mac. Now, Director
is an authoring package and I personally don't think that any comparison
between the two is sensible... There is *nothing* like Director on the Atari
platform, but I sure hope those German guys make DA's Interactive some day...

Well, now I've probably confused everyone...

Has anyone else had problems running MiNT 1.04 with the Minix XFS (version 0.55) installed? I have the filesystem running with MiNT 0.95, but when I try to use 1.04, the computer just hangs during the bootup sequence (right after the Minix XFS message). MiNT 1.04 works fine when I don't run the XFS, so I don't think it's the problem. I using a 4MB Mega STe with a Crazy Dots video card. I've tryed running from normal video with no other auto programs or accessories, but have had no luck. Any suggestions?

You need

- 16 of the same sort of RAM chips that are already in there
- 16 sockets
- 16 capacitors (same type as close to the 2 MB you already have)
- 3 resistors (same type as in the long row of res. left of the RAMs)

The resistors fit into the three empty resistor locations on the left of the RAM location.

That's all - Peter

trimmed down version of EdHak. Any help would be appreciated.

> Bob

Edhak/Diary were written by the same author. Edhak is a disk sector editor, as opposed to an ascii text editor. Earlier versions of Diary, such as 1.9 are limited to an eight K editor, and have a few less disabled features. If you want a fully working version of Diary, send the author his registration fee (I assume he still accepts them) and you should get the version that has a configurable buffer size (up to 64K, I believe).

5791. Falcon

Newsgroup: comp.sys.atari.st
Date: 1993-04-21 21:33:32 UTC
From: sytang@lamar.ColoState.EDU
Message-ID: <Apr21.213332.77796@yuma.ACNS.ColoState.EDU>
Source record: 206964

Ok, here is what it has on the falcon 030 that RUN PC just received:
It's a 4/65 configuration. And they were using the ST color monitor at this moment and might switch to multisync one later.
On the hard drive is AHDX 6.*, MultiTOS (Runs and quit stable but not many program tried), SpeedoGDOS, Atari Work, AFM (Audio Fun Machine). The machine seems to be very stable, some of the programs bombed but did not lock up the Falcon. The Cebit93 demo looks OK. The Protracker player plays sounds thru the DSP sounds quit good.

Where is Falcon FTP site?

Yeh, Cybernetix is pretty sharp, especially for shareware.

BTW, a new CYBERDROME demo should be uploaded to a.a. very soon. Let me
know if you still can't find it.

Yeah, but the point is : are you really going to multitask on the atari anyway? I rarely use multitasking on my DECstation 5000 at school running x-windows... I mainly task switch. Except the time I took 90% of the cpu time calculating all of the prime numbers from 1 to 10000000 ::snicker:: Just envision the DTP maniac.. like me... running Calamus SL in one window , Outline ART 3.0 in another while d/ling a 300k file from UMICH... ahhh that will be nice, but most of my time probably will be task switching, which will make my life very convenient!

>Is there a new version of the brilliant XYZmodem from A. Hamilton ??
>I'w got the V. 2.01

Speaking of which, does anyone know where to get the GEM RZ SZ accessory for use with CoNnect? Do I get it when I register CoNnect? I like CoNnect better than STalker in general, except for the Z-modem downolads. STalker handles that with great finesse! :) Also, CoNnect is rather difficult to use before registering! (which I will do as soon as is financially possible...)

>At least they're trying for a change!!

Yes, they are trying, but I think that people are entitled to a full package and documentation since they are actually bundling the thing, i.e. it's not a demo. Nice thing that they're giving it away with the systems. I wouldn't hav expected this from Atari a year ago.

What I think is more weird is that they're actually trying to sell the goddamn program for 150 bucks!! OK, that includes Speedo & some fonts, but as far as I'm concerned AW is *far* from a competitive product with regards to functionality and look. This little piece of code is dying for a decent interface (read: sensible design on dialogs and the like) and there's little you can't do with sh/w packages. On the plus side, there's the sound annotations and RTF support, and, again, the willingness to give something away.

Don't take my bitching too hard, though. AW is a single man's work. He has put down a considerable effort in this program. It's just not what I'd expected from the megahype people have been giving it in the online mags.

Since this thing is Atari's baby and it screams for an upgrade, I think that they need some hints from users about what's expected form a program like that. Where's the graphics? The communications part? Take a look at the integrated suites of progs on the Macs and they have 'em all.

OK, I'll shut up now... but think about it.

>in the selected window. Everything else is just sitting there--which is fine,
>being as a drawing program or whatever doesn't have much to do if I'm not
>telling it to do something.

This is *not* true. Programs in the background can do things. You can download and type in a word processor for example. Mac multitasking is called "cooperative multitasking" meaning that each program must give up time to let others run. If they don't allow that to happen, then they can steal all the CPU cycles. But, the call you are supposed to use to get events gives up CPU time, so each time through the event loop you let other programs at whack at the CPU time. Since most programs (like the drawing program) don't do anything till they recieve an event, they just sit there, doing nothing.

Now, the important thing to note is that the ST could always do this to a limited extent. The ST will multitask it's DA's (you can download in Stalker and type in EdHak for example).

And, for notes, the multitasking in MTOS is more UNIX like, it's preemptive, so no process can hog all the CPU cycles. It's also fun to throw a process in the trash to kill it!

Thus end the little lecture on multitasking. Just because it's not preemptive, doesn't mean it's not multitasking! (Again sorry for all the Mac goo here...but no use spreading misinformation! And it does point out one of the advantages of MTOS.)

I have to say EdHak is just really cool (and so is the author Craig Harvey..so buy ita nd make him rich!) If you use EdHack with STalker it's neat to use EdHack to change the occurance of "STeno" in STalker to EdHak so all the menu's and dialog boxes refer to EdHak. EdHak just has so many uses you almost can't do without it!

I haven't been using Speed of Light because it has a TREMENDOUS amount of
flicker in any mode that I have tried, including TTmedium. Is it supposed
to be this way? I get better results with ViewTT.

On my PTC1426 I don't see much flicker at all... Some pictures that have large areas of in-between colors I see it some, but it's worth the extra colors. TT Medium in ViewTT is horrible because you only get 16 colors and it chooses the wrong ones! :) Did you try changing the color contrast and flicker contrast? That might help. On Stu's (the author of Speed of Light) TT with a CTX multisync it looks great too... Maybe your eyes are just more sensitive than ours. Try it out on different monitors if you can and see if there's any difference...

> I got no response at all. I've asked locally at my friendly Atari store.
> I was told that it should be possible, but that they had no idea how
> it might be done. Nor did they particularly care to investigate.

OK, here's my results so far....

1: You have to define the monitor as LCD - it doesn't really support
Analogue video input (It works, but isn't very linear...)

2: The incoming sync pulses need inverting. This is best achieved
with either a cmos XOR package or a transistor inverter.
If you don't know how to do it, don't even contemplate it.. :-)

3: It'll only work in standard VGA mode.

OK, having said that, I'm trying to either find a circuit or IC
which will act as a universal sync decoder.

I want somethikng which basically only detects the leading sync
pulse edge, and doesn't care about the polarity, outputting
the -ve going pulses that the atari monitor requires.

There are 2 reasons for doing this

1: VGA cards change their sync polarity depending which mode they're
in - herc emulation is +,- while MVGA is +,+ for example.

2: It means I don't have to put a toggle switch on the back of the
monitor in order to be able to run it off both the atari and my
IBM. Currently I have 3 (Yes, 3!) monitors sitting on my desk,
and I want to get that number down as much as possible.
Being able to use the atari monitor as a paper-white VGA
will cut things down to 2. If I forget about Atari colour,
I can get down to 1.

Ultimately, the best course of action is to get a multisync monitor,
but I'm as pressed for cash as anyone else, so it'll have to wait...

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Has anyone bought XDebug from the ST Club in England. If you have, could you post your impressions of the product. It would be useful to know how well it integrates with Lattice C , and how it copes with multi-modules in C.

Thanks in advance.

- Chris

No you'll get it from Michael_Ziegler@m.maus.de. Perhaps you'll contact
him this way first. GEMSZRZ's version is 3.4 now and knows well to
run unter MTOS and achieves even there baudrates up to 3500 cps on
my TT. It's really worthwhile using it.
The price for it is DM 30,- but you should make sure that Michael
really gets DM30,- and not only the half because of banking charges
for foreign money transfers...

From: mebeb@liverpool.ac.uk
Message-ID: <C5vpsI.8JI@liverpool.ac.uk>
Source record: 206996

Incidentally, I'm getting a hell of a lot of crashes from it now.
In previous games I'd attempted to win fairly peacefully, but
the last few I decided to go all out to destroy everyone else
for a change, and now I'm frequently getting crashes on entering
a city display (notably only an enemy city I've captured, and only at
times of civil disorder). This is a real pain, since with a lot of
cities its easy to have one suddenly go into civil disorder when
an extra population unit is created, and there goes your game 8-(
Its getting to the stage where I'm having to save it every other
turn. To be honest, if it gets any worse I'd consider returning it
as unplayable - I'm certainly going to send in some of the (numerous)
save game files that will give an almost immediate crash upon loading
with my warranty card (doesn't scan very well, does it - I meant
send them in with my warranty card 8-)

>
>Me neither - not ANY version of MiNT (Well, not 0.95, 0.99, or 1.04).
>
>I'm just running TOSWIN as the INIT from MiNT.
>
That does of course not work. Toswin is a GEM program that requires
that GEM is running on the computer (GEM means especially the AES),
so if you start toswin from the autofolder, or as mint's init program,
it must crash, as the AES has not been started yet. Try bootgem.prg
as init program and install toswin as an accessory on the boot drive
then everything will be fine.
There might be a problem when running mint on a 68030 machine, as mint
uses memory protection on such a machine, but the normal (old) AES does
not work with memory protection turned on. One can swicth off protection
by renaming mint.prg to mintnp.prg, or writing an auto folder program
that starts mint with the parameter -m.

I hope this helps

Sure, NeoMaster is definately a very good drawing-program. I'm not
sure if it's available anywhere on the net though. See below.

: But I heard some
: things that some Neochrome versions are illegal in some way.

Unfortunately true. Neither Atari nor the original author would
listen or make a deal with the author of NeoMaster. This is mainly
becuase NeoMaster is a souped up recompiled version of the original
Neochrome (the only thing left somewhat intact is the way the interface
feels and looks, most of the other code is totally rewritten). I
believe NeoMaster has been put on ice though...

>They available anywhere except on GEnie & local BBS's?

Hmm, just might have to upload one of them to GEnie then (though at 2400 baud it would take forever). Then again, I use to be at 300 baud, so I know what it is to wait :-) (I'm at 38400 now, but normally only use one of GEnie's 2400 baud conections - for things like the RTC's, it's not worth the extra charge for the higher speeds)...

>Are they any good? Or just more wibbly-scrollers with the occassional
>sample thrown in? There aren't a lot of demos that really push the machine
>to the limit!

If Grotesque is the demo I think it is, is a very fast-paced, hyperactive demo - alot of screen flashing and what almost seems like silhouettes behind some of the flashes - sort of like MTV on speed... (if you can imagine that :-)

Hmm - people were making some complaints about lack of originality - I don't know if this idea is original, but it might have some ideas for a demo programmer: create a high-paced demo that works with those (cheap) 3D glasses that they sell evey time one of the local TV stations shows a 3D movie (you know, the glasses with one red lens and one blue lens?) - one step closer to virtual reality, maybe? [-)

Nope - GEMRZSZ is written by another author (I think it is shareware, but I'm not sure about that). Anyways, the author is from Germany, and I believe he is hooked into the internet (through Mausnet?). I sent him a message once, but I cannot remember his internet address off hand...

>I like
>CoNnect better than STalker in general, except for the Z-modem downolads.
>STalker handles that with great finesse! :)

Have you set up the downloads properly? You can have Connect automatically load in your chosen program (XYZ?) when you start up Zmodem on the host side (what some call "autozmodem"). That option is under the "Transfer" area where you set up the downloads to begin from. You'll be surprised how nice it is to simply type "sz file.lzh" from your unix prompt (assuming you're using unix :-) and have your protocol automatically kick into action. I've never used STalker, so I can't comment on how it compares, however...

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...has anyone else messed around with the "sounds" option of Connect? kinda cool to have different SNDs or MODs be triggered by various events...

5837. Hardware scrolling on Falcon.

Newsgroup: comp.sys.atari.st
Date: 1993-04-22 14:15:44 UTC
From: csg019@cch.coventry.ac.uk
Message-ID: <C5w2A9.30p@cck.coventry.ac.uk>
Source record: 207175

Greets all Falconers (bad start eh?)
I considering getting a Falcon to write games etc (mainly shoot-em-ups)
All i really want to know is how horizontal hardware scrolling is done on the
Falcon. The way i'm used to doing it on the Amiga is by having 2 screens
in RAM, and setting the screen modulo to 2 times the screen width, the
screen display is shifted 1 pixel by hardware, then after 16 pixels i blit
data to the left of the screen and the right of the screen, as soon as one
screen has been scrolled, i swap screens. Takes about 7 raster lines peak,
on an Amiga 500. How is the display scrolled on the Falcon.
(Were talking horizontalscrolling here.) NOT vertical.

Help appreciated.

-Steve.

For a _drawing_ program, I've always liked Migraph's Easy-Draw.

For a _paint_ program, Degas Elite has always been my standby.

Also, if you have a PC emulator on your ST, you can try one of the
commercial translators. I think there is a program called "German
Assistant" and another one by Berlitz that are supposed to provide
very good translations.

> I'm having a problem with the new sharable version of TCSH in that it
> can't seem to find my login.csh file (in the /etc folder). [...]

[description of several attempts to work around this deleted]

While it could still be a bug (I'll check this tonight), perhaps it's just one of the following reasons:

`tcsh' will only source your /etc/login.csh and $(HOME)/login.csh files if it has been started as a login shell. `tcsh' decites this by checking argv[0] (the name of the program as passed by the program that started `tcsh'): If it contains a "-" as the first character (the `login' program usually puts "-tcsh" into argv[0]) or if argv[0] does not exist (this happens if `tcsh' was run by a program that does not understand the ARGV argument passing scheme, e.g. the desktop), then it will behave like a login shell. It will _not_ behave like a login shell if it has been run by a program that does understand the ARGV scheme und doesn't put the "-" into argv[0]. (And, I believe it also won't act like a login shell if the environment variable HOME doesn't exist.)

In `TOSWIN', for example, you'll have to turn of the ARGV option if you want to behave a `tcsh' running in one of TOSWIN's windows as a login shell.

If you want to try if that's the reason why `tcsh' won't read your setup files, you could try running tcsh with the parameter "-l" which will also cause it to act as a login shell.

Hi.

I need a favour from someone...

I've found the source code to MORIA for the ST.. It's i C.
What I was wondering is if anyone would be willing to compile the code
for me..for a fee.. It's a game which is a classic.

You'll need a harddrive with at least 2Meg free to compile it and at
a fairly hefty compiler..

Anyone willing to oblige..?

Cheers
Craig

Mike, I saw your name yesterday on this news group and am very interested in your thoughts on cleaning up old recordings. I have an extensive collection of old 78's and had just begun to spec out a 486 when a friend of mine in Ireland mentioned the Falcon. When I get whatever I get, it must have the capability to do a good editing & noise reduction job on 3 to 4 minutes of music.

Although I am a novice to music software and Atari's, I have a Mac on my desk at work, am responsible for some Sun eauipment, and know my way around Dos to some extent.

Any suggestions, especially on PC's vs. Falcon, for the old recordings thing, would be most appreciated.

> I can think of ONE person who uses the desktop as a development
> environment.

Gee, I wonder who that might be referring to? ::grin:: Chris, I'm not the only one, just perhaps the most vocal.

Mail response I've gotten for my beta testers request indicates that there are a fair number of folks out there using GEMENV and STMAKE to enable program development from the desktop. Your 80% number is probably about right, actually.

To me, it's perfectly natural to instal TEMPUS as the application to handle double-clicks on .C, .H, .S, and other common programming-related file types, and STMAKE as the application to handle .MAK files. Then it doesn't take more than a click or two on the desktop to navigate your way around your development tasks. (Substitute your favorite editor for TEMPUS, of course. I don't love TEMPUS, but it's okay.)

> --Neuromancer

That is really good news! Though I wonder, how they do this. I looked
at the memory board in my Falcon and was impressed by the tiny size.
It is not much larger than a stack of say four or five credit cards.
It will be very hard, to fit ZIP-modules in that space!

Anyways, I enjoy having bought the 14Meg version in the first place
--- it is just wonderful, running MTOS without any (hardly any)
limitations imposed on the number/size of processes... Though the
speed really needs some improvement :-(

Source record: 207183

Hello everyone,

A friend at work has recently got hold of an STe and would be very interested
in getting hold of a shareware or PD program which can support the following:

- permit entry onto staves in standard musical notation
- support at least 2 staves
- import and export midi 0 or midi 1 format files
- the ability to play would be an advantage ;-)

Monitor resolution is not an issue: he has access to both colour and mono.

If anyone has any ideas or pointers, I would be very grateful to hear about
it. To save bandwidth, please reply by email to sbparker@infocom.co.uk and
I shall pass the messages along. Any interesting replies will be posted as
a summary.

Thanks

Steve

> Works and I am not saying that it is such a program) I think everybody is
> missing the point of intuitivness/GUIes.

Bulls**t. Well-written GUI programs need a much smaller, simpler manual,
but ALL complex software needs SOME kind of manual. If only to discover
what its *features* are. My first impression when I've used Mac software
like Word is that the interface is extremely sparse, which is good, but
it is also completely non-obvious what its hidden features are. Not
everything is accessible directly from a menu bar. I would say an integrated
"works" type package is a complex program. For example, something not
that intuitive like can the equation editor handle multi-line equations
and keep them all on one page. Or what is the row/col limit in the spreadsheet?
At some point you have to touch a keyboard when using a word processor, and
a technical reference is a necessity in general.

5855. SUMMARY: FAX software for the ST

Newsgroup: comp.sys.atari.st
Date: 1993-04-22 18:01:57 UTC
From: Michel Goudeseune <michelg@zooid.guild.org>
Message-ID: <1993Apr22.180157.13762@zooid.guild.org>
Source record: 207197
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Here's the information I received about FAX software for the ST.

[I have freely cut and pasted the various replies.]

There are several programs available:

Straight Fax!

Developed in the US by Joppa, requires 1 Meg RAM, works in colour or mono. I seem to remember the article saying they couldn't get it to work with some of the modems they tried. (I'm just guessing, but this software might be known as Joppa Fax in the US - I seem to remember seeing an ad for a product with a name like that in an old issue of Current Notes.)

You've probably already read this a gazillion times, but you can't do better than StraightFAX on the ST... It's available from Toad Computers.

Straight Fax is by Toad Computer
570-F Gov
Ritchie Hwl.Sevena Park
MD 21146 USA

Straight Fax cost 99$ [currency? us$, I think -MG]

Tele Office

Developed in Germany by TKR, requires 1 Meg RAM, works in mono. The article said they couldn't get it to work in colour, but admitted this might be because it was a beta version.

According to the review, Tele Office was much more powerful and flexible, but not quite as easy to use. Both were quoted at the same price, about 60 pounds sterling. I'm not aware of any PD or shareware FAX software being available yet...

Based on this, I recently bought Tele Office to use with my SupraFAX v32bis modem. I haven't used the software much yet, but I did get as far as testing it by successfully sending a FAX to someone. I needed help to set it up though, because the supplier sent it without a manual. They warned me about this before I bought it, so I knew what I was getting into ! :-) It was still being translated into English from German at the time; this has now been completed and I received a copy of the manual recently. And the support I got from the supplier over the phone was good enough to help me get going.

As I say, I haven't used it much, so I don't know whether all the features work well or not yet - and I haven't tried it with a colour monitor, so this is all I can tell you.

HackFAX

If you bought a ZyXEL you can use HackFAX. Search for the archive HFAX060.LZH.

Michel, I noticed on a recent pass through the Newitems driectory at atari.archive.umich.edu a program called 'hfaxbeta'...take a look, it may be a fax package!

[Note: I haven't checked out either of these yet. I have a SupraFAX modem, so I'll see if this will actually work with mine.]

There was also a referral to the December 1992 issue of Atari ST User, the UK version at least. It gave a review of StraightFAX and TeleOffice. A summary of the review is included above.

Q-FAX/Pro

[Does anybody know anything about this one? :-)]

That is all! Thanks again to the contributors. For a list of the contributors, ask me in email.

Michel Goudeseune -- michelg@zooid.guild.org

5856. availability of Speedo GDOS printer drivers

Newsgroup: comp.sys.atari.st
Date: 1993-04-22 19:17:44 UTC
From: michael.smith@f842.n800.z3.fido.zeta.org.au
Message-ID: <bd894f38@Kralizec.fido.zeta.org.au>
Source record: 206946

Having had a chance to play with/use Speedo GDOS, I'm quite impressed with its speed and robustness.

However, it seems to suffer from the typical GDOS malaise - bugger all in the way of printer drivers.

I notice that the 'old' style printer drivers don't work - that's quite understandable really, but you get BJ10, FX-80, HP deskjet & laserjet, SLM and NX-1000 drivers. Nothing useful like a 24-pin epson driver, or a proprinter driver (although the jury is out on whether or not the BJ driver will work like that).

Anyway, this is what I'm asking - Are there more drivers?

If yes, where do I get them?

Replies as you wish...

5857. Atari 1040 - Sell or Trade for PC

Newsgroup: comp.sys.atari.st
Date: 1993-04-22 19:28:31 UTC
From: ladasky@netcom.com
Message-ID: <ladaskyC5wGrJ.MvD@netcom.com>
Source record: 207180
Cross-posted to:
comp.sys.atari.st,comp.sys.ibm.pc.hardware,ba.wanted,ba.market.computers,rec.music.makers.synth,rec.music.marketplace

I am considering selling an Atari 1040 and purchasing an IBM compa-
tible. I need to know what kind of money or trade I can expect to get for
the Atari before I bother. I am about to start graduate school, and that
means I'm about to be poor! (There's a price list for used synthesizers on
rec.music.makers.synth, but no equivalent list for computers...)

This system is tailor-made for a MIDI musician. Details follow:

* Atari 1040 ST
TOS 1.0
1 MB RAM
720K floppy drive

* SupraDrive 20 Mb external SCSI drive, 18 months old

* 12" Atari monochrome monitor

* Generic 2400 baud external modem

* Software: All software is registered and comes with manuals.
Passport's Master Tracks Pro, Version 2.5 (sequencing software)
Dr. T's Copyist Professional (scoring software)
First Word (word processor - *not* the PD version)
Megamax's Laser C, Version 2.0 (programming language)
VIP Professional (spreadsheet package - low-tech Lotus clone)
Partner ST (desk accessory with integrated calendar, cardfile, etc.)
Migraph's Easy Draw (an early, pre-Postscript release)
NeoDesk (improved desktop for Atari ST)
Universal III (improved file selector for Atari ST)
Miscellaneous software (including Uniterm communications software)

I will consider all prices above $900. I am also willing to
trade the Atari system for a quality (386 or 486) PC, including lap-tops.
I own some PC hardware, so a complete system may not be necessary.

German Assistant works much better. It also costs much more ($99 vs Free).
It does a very nice job getting almos 90% right while you`ll be lucky if
you get 50% with GER2EN21.LZH :)

If anyone has any ideas how to make a sentence to sentence program, please
drop me a line. My studies are Engineering, not programming :)

I tested it on 2 MegaSTEs on the Atari show and it bombed on both while loading.
Thanx for the comments.

> (Were talking horizontalscrolling here.) NOT vertical.
> Help appreciated.
> -Steve.
>

Yeah, that's the way to go :)

The way you would do it on the Falcon is:

Assuming you would be using bitplane modes this is how to do it:

1. set the line width register to 2x normal screen width
2. change the pixel shifter register from 0 to 15
3. do your left/right blitting
4. swap the screens when one screen is done.

All pretty much the same as on the amiga really. One thing to remember is that
you have to subtract 1 chunk from the line width when the pixel counter is > 0
because the hardware adds 1 automatically...

This was assuming you were using bitplane modes.. BUT the big thing on the
falcon is it's word mode really.. then each pixel is a word and there's no
boring bitplanes to care about. Then you forget the whole pixel thing and
just set up the 2x line width, and add two to the screen pointer to get
scrolling. gfx will be bigger but you'll save loads on not having to have
the sprites pre-shifted in RAM so it'll make up for the larger size I'd say.
things will be more colorful too..

However the biggest problem for an ex-amiga programmer moving to Atari is
probably the fact that there's no longer a usable blitter. If you want FAST
sprites you'll have to do it yourself.

Ah well, this is getting longer than I intended really. any more questions,
email me and I'll do my best :)
```

5862. Certificate Maker printer driver?

Newsgroup: comp.sys.atari.st
Date: 1993-04-22 20:21:48 UTC
From: wallace_r@msbcs.enet.dec.com
Message-ID: <1993Apr22.192116.10257@nntpd.lkg.dec.com>
Source record: 207179

My kids use (were using :-(a program called Certificate Maker. Now that I replaced the 9 pin printer with a 24 pin Panasonic printer the program no longer works. Since Certificate Maker has a menu option for selecting a printer (out of a list of a dozen or so) I thought there might be some 24 pin printer drivers available for it somewhere.

Does anyone know where (or if) I can get a 24 pin printer driver for Certificate Maker?

Thanks,

Ray Wallace

i downloaded the hi fi dreams demo yesterday and it worked flawlessly.
make sure that you are ftp'ing in binary (image) mode. also make sure
that you have the latest version of your un-archiver.

For those who doesn't really care if Atari likes it or not, NeoMaster v2.28 is available by anonymous FTP from ftp.cs.tu-berlin.de as /pub/atari/graphic/neo_2_28.lzh. As explained earlier this program is not 100 percent legal (at least not to my knowledge) since it really is a souped-up recompiled version of the original Neochrome.

I'll upload it to a.a.u.e, but it's up to the maintainers if they want to make it available to the public or not.

If you have problems getting the file then email me and I'll send you a uuencoded copy.

Hello!

does anyone know if there is a program which can test the CPU speed like
the Norton Commander for DOS ?
I don't mean something like "243% 100=8MHz".
This would mean to me that the 030 is just 2,43 times fast than 68000 and
not 4 times as I thought.

Thanx for answer

Not PD, but EZ-Score+ is only about $100, and works very well, up to 3 staves per system. You need the freeware program MIDIMover to allow it to import and export MIDI files, but it's no problem getting hold of that. Best used in monochrome, but it also works in color.

I've also used QuickScore in the Dr. T's Omega package; it's pretty much a joke. I would never use it to produce any of my music... On the other hand, the KCS sequencer in the package was terrific to use. Very powerful and pretty easy to understand.

I just switched to CuBase 3.01, which is pretty intense. Still learning here...

I seriously doubt Stalker relies on the limited multitasking of desk accessories to download files. Once I tested out the limited multitasking of desk accessories by making a timer that used timer events to count down the specified time. Worked great from the desktop, but execute an application and the DA was put to sleep, therefore the timer alarm never sounded. The way I was able to achieve "multitasking" in my timer was to install a vertical blank interrupt routine in the queue. Similarly, one could download files in the background using serial port interrupts.

>>CLI's a far too slow for my purposes ...
>>quick access to what I wan't without having to CD to directories

>Ah, there speaks someone who has never really used a CLI/shell.

If someone is only using a few applications/tools, a GUI like the later GEM desktop (or GEMINI, or NeoDESK) where icons can be dragged to the desktop is best - since that is effectively a MENU of options.

I do this with all my "applications" (DTP, GEM viewers, etc.).

But when you have 100s of tools (wanna listing of my bin directories!!), a MENU interface to them (whether all dragged onto destop, or all displayed in a file window) is too difficult. When I want to find the difference between two files, I want to run "diff filea fileb", not open the "bin" folder, find "diff.ttp", double-click, THEN type filea fileb (with absolute paths to the files!!).

GUIs are great for certain things. CLIs are great for certain things.

I'm MUCH more comfortable dragging files to the Trash than typing "rm ..." for example (better feedback).

But I also like to type "art" and have that be aliased to:

rez 0; cd /app/crackart.100; crackart; rez 1; colour

Than to try to do that from the desktop :)

Not to mention shell scripts.

```
for i in *.cc
do
if [ -f ../oldsrc/$i ]]
then
diff $i ../oldsrc/$i
else
echo "$i is a new file"
fi
done > what_is.new
```

oops.

I'm using an NEC 3D. With ViewTT, I don't view the pictures in TT medium, but in TTlow from TTmedium (it automatically jumps to TTlow).

I tried playing with the color and flicker contrast, but it didn't do much at all.

The whole image flickers a lot, not just sections of it. A little flicker I can handle, but the images really flicker a lot -- like a strobe.

Probably all completely illogical, arbitrary, and incompatible with every
other archiver on Earth (a la PK-ZIP), thus necessitating special treatment
by things like CFJ's ARCshell...

I'll stick with zoo... I have a feeling it'll be more multitasking friendly
(ie, won't hog the CPU/RAM when I'm running it in the background).

Here, let me guess what they wrote:

Windows NT - fawning praise, "This will RULE D00D, when it's released!"

OS/2 - requires too much RAM/disk space

Windows 3.1 - RULEZ D00D! We love it!

System 7.1 - Too bad we can't afford a Mac. That's OK, we love WIND0ZE!

MultiTOS - Atari still makes computers?

Well, I grabbed newnet.zoo and now I have working telnet and ftp on my atari!!! I am psyched.. Now all I have to do is upgrade from my v.32 to v.32bis and I will be set. 9600 baud slip just doesn't seem fast enough.

John

P.S. I cant remeber who updated the net.ttp for me, but I appreciate it a lot!

Ther's an acessory wich allows this, but in a slightly different way:

chameleon, from Julian Reschke (I think he programmed it). You put one or more copies of this one in the boot partition, the other accessories in a folder. There's a place in chameleon you can edit (with any track-to-track editor) to specify an acessory which have to be loaded when booting. That's it.
What's better is that you can later unload the accessory and replace it by another one.

Hope this helps....

Okay, am I to understand that it is terribly difficult to multitask with
less than say, oh, 1200x960x24bit? I can get an amazing amount of throughput
just logging on to the HP9000/845 (that this is posted from) using my TT as
a dumb ASCII terminal in monochrome. I know that I could do the same at
home if I felt like downloading and setting up MiNT. At 14.4kbps it
wouldn't take that long, but I haven't felt a need, since I can do whatever
I need to do either online using a dumb ASCII term, or at home in GEM.
Maybe some people feel a compulsion to compile their source code with a nice
24bit color JPEG underneath all their open windows, but not I. So I would
suggest to potential Falcon buyers that they buy what they want to buy, and
not necessarily be persuaded by the "Faster and more colors is cooler" crowd.

I don't understand this sudden need I have to be an Atari Cheerleader (tm),
but Atari Corp has a well documented history of getting their butt
publicly whipped, then somehow rising out of it. During the price wars of
that happened around '84, Atari lost a huge amount of money. Chrysler Corp
lost a comprable amount of money about the same time, and required a large
federal loan to stay afloat. Atari managed on their own. You may argue
that Atari under the Tramiels is far different from Atari under Time/Warner,
but the fact remains: Atari has a knack for surviving even when under very
deep doo-doo. I don't expect them to ever claim significant market share,
but they will manage to put products out the door (however late) and
maintain an interest base just large enough keep quality software coming
down the line...

But Moria is already compiled for the Atari ST. I think it is at least
on atari.archive.umich.edu and its mirrors.
I think it was compiled by the same man that compiled Omega, another
classic like Moria.
By the way the version I have is version 5.4.

For extracting the newer methods on Unix/NeXT workstations, use the LHA
program. I bugged our sysadm a few times and sent him source code and
now it is installed on our Decstations, so I now no longer have
problems extracting files on the workstations here.

I am not aware that Atari Works has an equation editor yet. It would be
a nice addition though. I think at the moment they have to be created
using a vector drawing program of some sort. Like Mydraw or
kandinsky.

I am having trouble with my TOS 1.0 ST. (All right , settle down, it
has 1Mb of memory) It starts up, allows me to move my tribe, then freezes.
None of the menus or keys function. I can think of two possible reasons for
this.
1) It just doesnt run under TOS 1.0
2) Various applications (GDOS, the print spooler etc) have eaten just
enough memory to destabilise Civ.

not forgetting option 3) something else

Does anyone out there know which TOS versions might be expected to run
Civ, and how much free memory it actually needs?

>The whole image flickers a lot, not just sections of it. A little flicker
>I can handle, but the images really flicker a lot -- like a strobe.

Wait, I don't understand you, or maybe you don't know enough about the program. First of all, if you don't want it to flicker, JUST SET FLICKER CONTRAST TO ZERO! That way, it won't flicker at all! If it does, than you're probably doing something wrong. You can't run this version in fast Ram if you have a TT, version 3.0 will work, however (it does on mine).

Not only is Speed of Light faster that ViewTT, but it chooses the colors better as Dan said. If you want a WORSE representation of the actual GIF, but something still 100 times better that ViewTT then set the flicker contrast to zero! You've got to be doing something wrong because there is hardly any flickering on my TT in any resolution, and that's with flicker contrast set high. I'm sure a lot of people will back me up on this!! Anyone?

>Thanks in advance.

Apart from convenient single stepping at the program source level, and accessing local variables by name, it doesn't offer a great deal more than the MonSTC debugger that came with Lattice. And the screen updates are much slower. And it has trouble locating sources which are in more than one directory - but I think I may be able to get this bit working, I just haven't had time to play, recently.

What amazed me was that a source level debugger can claim to be such when it does not understand typedefs and structures etc (You can only display 'simple' variables).

It's nice to be able to configure so many options, though. I did think that the key combinations in monstc were far from intuitive. The default setup for XDEBUG is based on CodeView.

4 out of 10, I reckon.

First of all sorry to everyone else... I can't EMAIL to that site because
of current complications with domain names and cs being changed from
Czechoslovakia at the moment and all sorts of other mail problems.

Warwick,
As it says above I can't currently mail you because of some really
weird mailing problems in the UK caused by the rearrangement of various
country domains. Anyway, here is the mail I attempted to send you before it
bounced...

If you can't make the Desktop come up under MiNT I would imagine you will
have problems getting my program up. My program needs GEM to be booted and
if you put any program as the INIT in MINT.CNF (except BOOTGEM.PRG) that
simply doesn't happen. Have you tried booting with no AUTO's or ACC's (apart
from MiNT of course) with an empty MINT.CNF file... If that doesn't work
there's something very wrong somewhere.
If you're already setting the INIT of MINT.CNF to something which isn't
BOOTGEM.PRG... this WILL stop the AES working. If the program is a GEM
application then it will throw a complete wobbler. If you want a GEM
program to autoboot, don't have an INIT line in MINT.CNF and install the
program to autoboot using Install Application (or whatever it's called)
on the Desktop 'Options' menu.
Using this method I've happily got my program to come up straight away
without starting the Desktop. I assume this method will work still for
MultiTOS... I don't know. MultiTOS boots the new AES from disk using a
file called GEM.SYS.

If you get this working let me know and I'll then add you to the list of
testers for my program...

Bye for now,
Steve.

Hello everybody!

I want to install a version of LaTeX for my Atari TT.
I have a bubble jet printed BJ 10ex
and I want to know what files are needed for having a small but running
version of LaTeX.

I look in the directory Tex in the ftp server
and they seems to have very high number of files!

I want LaTeX,
a gem DVI viewer
and a program to print file on my BJ10ex

Could someone is able to tell me what files I need?

Thanks by advance.

Jerome.

Source record: 207073

Talking of shells .... I have a problem with a version of SH for the ST (a very old version at that). The problem (I think) is that the shell grabs roughly 20 bytes for the PATH variable. If I was using a ramdisk, then it would be ok:

PATH=m:\bin

BUT I use my 20Meg HD, which has:

c:\bin\editors
c:\bin\unix
c:\bin\utils
d:\devpac\bin
d:\lattice\bin
e:\tex\bin

(at least :)

Which is much more than it can handle.

Does anyone know of a PD version of SH for TOS (I know there's a MiNT version ... I haven't enough memory/money for that option) or a similar shell.

I have GULAM, but its filename-completion annoys me (I'm used to TSCH under UNIX), and a simple shell like SH would suit me fine.

Dave.

PS: I use the original GEM desktop, but I have a home made accessory with options like:

Enter Gulam
Edit File
Reboot Computer

A bit apple mac-ish !! And a suite of programs that correspond to .c, .o, .tex files and the like !! A handy interface, and a way round the non-draggable icons of old GEM (+ absolutely free !!)

>and incredibly red (I'm not sure why... _all_ of the graphics have this
>gross red tinge).
>
OK, it's a little slow on an ST, but the game is worth buying. The story is
really complex (not the kind of game where you just have to kill every monster
and find hidden treasures), you will learn your (long) task during the game,
by talking to the people you meet and resolving little quests for them.
The exploration of dungeons is less easy than in the previous games (no more in
Dungeon Master style), and certainly more boring, but the world is incredibly
large, as for the number of persons you can meet.
About the red colors, I made some changes in the palette of some files to make
things look more pretty. If someone is interested, I can mail those files.

The only true Avatar.

Well Michael makes what I would call the Best Zmodem program for the Atari,
BUT its all in German and there is no GEM shell to drive it..

Michael could sell 1000 more copies if he did ,,

1. a Full English version.

2. A GEM shell that has, one support for Batch Uploads using the ARGV standard,
and be able to set the dnload path, other comms programs can then use his
program...

3. Get BankCard support, you Germans seem to lack one of the best ways
to purchase by mail order..

I do suggest you use a Bank Draft/Bank Cheque made out in Deutschmarks,
then there is no problem...

Roger..... sheppard_r@kosmos.wcc.govt.nz

Works OK for me - what are you doing to get the files ? Which version of msa
are you using to recreate the demo disks ? If you want help, we need more
information really.

|> then and ST will read/write the disk perfectly.
|>
|> end of story.
|> Dom

That's not quite true actually Dom. The Sun SPARC station 10 at work (my access to the Usenet/Internet) has a floopy drive, takes the right disks and even has some software on it (MSTOOLS circa 1989) that will copy files onto the DOS formatted disk, low or high density - it's auto sensing. But, when you put these disks in the atari text files consist of the first ~80 lines only, repeated enough time to make up the correct file length. This happens even when using the text copy mode of the software. Binary file are unusable.

If anyone has any suggestions at how I can avoid having to use a Mac as a middle man to get files from the Sun to my STe I'm all ears.

Martin

P.S. I've cross posted this to the c.s.a.s.tech group in case anyone there has any ideas about Sun UNIX to STe transfer of files.

Source record: 207082

How come only a small percentage of the demos produced on the Atari/s end up on the a.a?

Surely coders who have spent several months on a project would like it to reach as many users as possible, not just those in their direct chain of swappers.

If a good up-to-date demo archive exists, could someone please inform the other net users of it's whereabouts?

Get the latest version of Mtools. Version v2.0.5 was posted to the
comp.sources.unix news group the 2nd week of January 92 as v25i097
thru v25i099. Subsequent patches have brought the version up to
v2.0.7. I have no trouble reading and writing Atari disks on my old
Sparc 1.

The symptoms you describe suggest a messed up FAT. This could be as
simple as a media change problem. For example, if you format a disk
on your STe, move it to the Sparc, write a file on it, and then move
it back to your Ste, the old FAT is still cached in the Atari. You
need to force a media change to cause the FAT to be reread from disk.
This can be done by opening a window on the disk and then pressing ESC
(for TOS 1.4 and later). Similar problems could conceivably occur if
the disk is not formatted properly. Try letting Mtools do the
formatting (using mformat) and then see if it is readable on the
Atari. The Atari is fairly generous about what it can read.

A couple of caveats: (1) Mtools as distributed only handles standard
9-sector disks. It is possible to get the Sparc 1 to read and write
10-sector disks, but the method is not supported by Sun and has some
problems. Things might be different on the Sparc 10. (2) Mtools
assumes MSDOS conventions for text files; namely, it converts Unix
newlines to MSDOS <CR><LF> and put a ^Z at the end of the file. An
easy code modification eliminates the ^Z for Atari use.

You probably need a newer versions of Mtools. I'm using 2.0.4 (1991) and it works
fine.

Hi,

I've read a lot of crashing civilization games and people who send their complaints (incl. save disk and warranty card) to MicroProse.

Has anyone of that people got support/help meanwhile, something like an update or any kind of fix ?

I'm waiting to buy Civilization for my ST, but first I wanna be sure to get a working version.

Lars

That's not necessarily a good answer. If the Ani Pro file format
addresses pixel colours via registers, (and I expect it does) then
it takes an extra step in the translation to map the colours. That's
going to slow things down.

>Now, to say that one system is better than another (or to say that one
>is more "brain-dead" than another) is pure naivety. Each style has
>greater and lesser consequences.

I'm sorry, but I can't agree with that. My position is that
for cases 1 and 3 you are correct in saying there are significant
advantages and disadvantages which make either a legitimate choice,
but having worked all 3 types of displays to some extent, the Atari
form with is case 2 *is* "brain dead". It generally has the
disadvantages of both without the advantages.

>One of the greatest advantages of (3) is that you don't have to use all
>the bitplanes. (2) also has this advantage, but has the added advantage
>that when you do use all bitplanes, access is still very fast (because it
>is still local).

This isn't generally true. There are two scenarios for graphic
memory accesses, 1) by the processor(s), and 2) by display. In Ataris
and Amigas the "processors" includes blitters and any custom chips
as well as the CPU. Since the custom processing chips can be designed
to address via offsets of internal registers, they can be designed
to address bit plane size block offsets pretty much as efficiently as by
incrementing the register. As for the CPU, in theory things are
a bit trickier to analyse. There aren't many cases where it's useful
to read 2 words into a register at the same time, which is the most
efficient "Read" mode for a 68K processor, because then you end up
with, say the LSb in the high word and the NextLSb in the low word.
What are you going to do at that point? You can copy the register
to another register and then shift it. That's 2 instructions.
I don't have a cycle count handy, but if it's in cache, that's probably
just a tad quicker than 2 separate 1 word reads, but you'll lose the
advantage if you fall out of the cache (I'm assuming an 020 or above--
probably no advantage at all for 68000 or '010). On the other hand,
for a full bitplane system, if you have enough address registers free
you can set up 1 register address each, pointed at the bases for each
bitplane and address that way fairly quick. It's unlikely you'll

find any advantage to "word bitplane" addressing over regular "single bit" bitplanes. Let's leave the generalizations behind and try the "real world" test. If you can show me an example of useful code that demonstrates an advantage of the Falcon's 16 bit interleave over the Amiga 1200's full bit plane, post it and we'll look at it from that standpoint. Keeping in mind that few people have both a Falcon and an Amiga 1200 handy, we'll allow for a bit fudging on it being "real world". At least both computers exist so the ideas can be checked. But stick to *useful* code examples.

...

>The Falcon gives you the very best of both worlds - word-interleaved
>modes right up to 8 interleaved bitplanes, and a 16-bit (word-per-pixel)
>bit interleaved mode.

In my terms that would be the "crippled word-interleave modes right up to 8 interleaved bitplanes and a crippled 16-bit (word-per-pixel) mode (because it doesn't have colour registers)."

>IMO, you can't ASK for much more than that (except extremes like 24-bit,
>32-bit), but Ian would complain about those too ("Waaaaa, you have to modify
>4 bytes just to change one pixel!")

That's 1 "LONG". That's not going to bother Ian. He knows that that's a single read or write for an '030. *You* might have a problem with that if you don't understand that this is the natural addressing size of the '030 rather than 16 bits, but Ian? No, I don't think Ian would have a problem with that. :-)

OS/2 take too much room?!?!?!??!??!? I don't think so. NT take 80 megs disk space, minimum, with a 20meg Swapfile. NeXTStep Intel takes 130(!!) megs for the user version and 330 for the developers version. (And if you want 24 bit color, you _NEED_ 32 megs RAM. This is getting a wee bit out of control...)

> Windows 3.1 - RULEZ D00D! We love it!
It has it's good points. Don't compare to everything else, compare it to something like GEOS.... _Then_ you'll see why so many people love it, compare it to the alternitives...

> System 7.1 - Too bad we can't afford a Mac. That's OK, we love WIND0ZE!
[Personal Note: Who would want a Mac anyway? (Boy, is it getting hot in here) Please! Just a little comment, flame me in mail or in .advocacy, PLEASE!]

> MultiTOS - Atari still makes computers?
Yup. And for the cost, they're damn good, too.

Now, before you flame me, I want everyone to know I _do_ notice that the whole premise of this article is what the magazine thinks, but 30 over 80 (and 130/330!), not too big, nice and tiny. Anybody remember what Brodie said the size of the disk portion of MTOS was? About 800k. Less that 1 disk. THAT's compact, folks. Optimized code.

Oh well, now that I've (in)advertantly started another flame war (God, I hope not), I'd like to again please ask that if your sense of pride has been seriously injured by what I've said, flame me in mail or in .advocacy, there's places for that.

I've said my peace.

NO! That's not it at all. Some just wish the Falcon had an 800x600x8bit mode,
and a 1024x768x1bit mode. I use mono on my ST much more than color.. It's just
that 2 file windows of the size I like, and my screen is FULL! So I like my
windows 250x400.. That's NOT that large.. I have a 1280x1024 NEC 5D at work
here, and a 80x40 xterm in 8x13 font takes up 85% of the screen, so to see
the output of more than one window at a time, I have to reduce to a really
small 6x13 font.. So, while 21 inches provides a much nicer environment, it's
still not that great.. I rarely use color - I don't mind monochrome much..

5914. New Atari Purchase

Newsgroup: comp.sys.atari.st
Date: 1993-04-23 16:41:02 UTC
From: neurom@u.washington.edu
Message-ID: <1r966uINNq6p@shelley.u.washington.edu>
Source record: 207091

Hello, folks. I running into a bit of an impasse at home, as I still have my 520 ST (Note: No e, no m, and no f) w/ TOS 1.0 and 512k RAM. Hey, it does what I want it to, but now I want more. I'm decideing whether I should upgrade and I'd like to ask you, the folks we all know are experts [yeah, right ;)] on what your opinion is. My choices, basicly, are:

1) Upgrade my ST to:
4 Megs RAM
TOS 1.4
120meg SCSI HD w/ ICD+ clock Host
Add NeoDesk 3.0, Universal Item Selector III (?), and Warp 9

2) Get a Falcon030 as a 4/65 config and add an external SCSI II 120 meg HD.

3) Get a Falcon030 as a 1/0 config and:
Get a RAM expansion board
Populate said board w/ 4 megs ZIP RAM
Get Internal 120meg Maxtor HD

Now, the prices differenciate about $300. (I can't tell you the prices; I can buy at dealer cost and if I revealed cost, I'd be in _ddeeeeeeeeepp_ do do.) i.e. 1) is $300 less that 2). 3) is about $60 less that 2), and I get the capability to upgrade to 14megs for just the ZIP cost. Then again, I get 65 megs more storage w/ 2), and I can get 2) now, while I have to wait for 3).....

AAAAaaaaggggggghhhhhhh!!!!!!!

You see why I've gone slightly mad? Anything would be a radical improvement over my ST now, so I'm not sure if I should spend more money, or less, and if I should.... hell with it.

Thanks for reading, if you don't care, just leave me alone...."I'm going, slightly mad."

Well the docu is in german. The program is in english. But this certainly
won't help you.

>2. A GEM shell that has, one support for Batch Uploads using the ARGV standard,
> and be able to set the dnload path, other comms programs can then use his
> program...

You can pass parameters to GEMSZRZ.PRG using the ARGV-standard. Using option
-P <path> you can set the download path. And adding more than one file
to the commandline will upload them in batch upload. Try this using CoNnect
and the fileselector Selectric where you can select more than one file
in a single step. CoNnect will pass all the selected files to gemszrz
which then will upload them by batch upload.

From: evanlang@sdf.lonestar.org
Message-ID: <C5y4pw.6D8@sdf.lonestar.org>
Source record: 206907
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

OK, folks, here is the problem.

To use VDI commands you need to open a VDI workstation and all the commansd work on the screen. Now, I want to draw, using VDI, onto a buffer!

I thought about just opening a VDI workstation, and then moving logbase to that buffer, then I could do the VDi command, and move logbase back where it was. This doesn't seem to be the correct approach. Is there a better one?

Also, what if the other scrren (in the buffer) in in a different resolution. Is there any way to trick the VDI into doing it correctly? This has to work under MiNT/MultiTOS so I don't want to do anything global to screw up the system and I don't want to use ANY LineA. However, different resolutions are just kinda a nicety right now. It doesn't HAVE to be different resolutions.

What if I were in ST Med, and I did my drawing on a buffer screen moving logbase (assuming this will work at all), could I then bit-blit this onto a low-res buffer ? It seems the only way to draw between resolutions is through bit-blit since that is the only time you can specify different screen resolutions and number of bit-planes (which is likely why the Falcon uses bit-planes for 256 color mode. Compatibility with vro_cpyfm()). But would I be able to get the extra colors this way?? Any help would be appreciated.

Basically these screens are gonna be used as window buffers and the redraw will just be a vro_cpyfm(). And when the user hits the FULLER I'll either increase the window to full size and remove all the gadgets or move physbase to my buffer with Setscreen() - possibly changing resolution too. This option will be user selectable.

I can't store the data any other way since there could be who knows how much VDI graphics that need to go into the window, and I refuse to redraw everything just cause the user hit the arrow on the scroll bar (do you know how slow 20-30 VDI commands per line would be???). Again there is no way to know at programming time, exactly what VDI commands will be used. This is for a terminal program that uses both text and graphics and sound, etc. etc.

5923. FALCON - Blitter vs. CPU

Newsgroup: comp.sys.atari.st
Date: 1993-04-23 19:32:43 UTC
From: se18@titus.nextlab.cs.qub.ac.uk
Message-ID: <1993Apr23.193243.2226@ousrvr.oulu.fi>
Source record: 207095
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

According to the Falcon documentation, the Blitter is a coproceesor
which to me means it runs in parallel with the CPU. Even if it did not
have interleaved memory access (as of DMA on STE) it could still aquire a
large amount of bus cycles due to the CPU's cache(this will depend on the
Cache hit ratio).
So the question is 'Why are people saying that the Blitter is
useless', as it should be able to work in parallel with the CPU.
Please state the source of your 'facts', or system timings, and not
speculative remarks.

Not to mention the Blitter has 32-bit wide access to RAM and the CPU only has 16-bit access. In some situations this might help. But in some situations you would only want to do 16-bit access to RAM with the CPU EVEN IF IT HAD 32-Bit ACCESS. Any situation where you 'calculate' the color of a pixel, you would want to go ahead and store that pixel instead of trying to calculate 2 pixels at once. I don't think that the 16-bit bus to the CPU was as bad as everyone has made it out to be. Even in the game I am working on now I would still use 16-bit accesses to RAM because it would be faster than trying to put together a 32-bit screen chunk.

>the user version and 330 for the developers version. (And if you want 24 bit
>color, you _NEED_ 32 megs RAM. This is getting a wee bit out of control...)

OS/2 isnt even in the same class as Win-NT. Supposedly Win-NT has pretty
much nothing in common with Windows 3.x, outside of the name, and an API
(and probably the UI).

Myself, after hating Windows 3.1 for so long, am looking forware to NT,
its got quite a bit in common with VMS, like the task scheheduling,
event flags, and others. I dont think itll be much like Unix, tho...

Tho, Microsoft is known for pretty shitty code, I cant see the first
version of NT being better than VMS or Unix (who both have more than 20
years of experience behind them), and Microsoft doesnt know how
to write a real OS, theyve been writing DOS for 10 years, and CP/M stuff
prior to that...

>It's also the best thing I've seen for working on long technical manuals
>(which is what I do; pity Atari hasn't caught on to the fact that
>documentation is IMPORTANT these days).

It certainly is good for long technical documents. (I thought that
Calumus SL had some of those features? I was led to believe so by someone
who has used both.)

Anyway, it just weird to see NeXT, Framemaker, and drooling in such close
context. I'd understand if it had been Pages/PasteUp/Virtuoso. Frame
purposely does not use the power that NeXTSTEP offers to be easily compatible
to other platforms.

Of course, PasteUp and Virtuoso don't excel at long documents...but for
short DTP they (and Calumus,Quark,and Pagemaker) all blow Frame apart.
Who knows what Pages will be like for long documents. Though you'd think
it'd do it well as businesses seem to be it's major market.

All in all, with Calumus SL, Atari is one of the best platforms for
DTP. Hey the people at Seybold really like Calumus...and why do you think
Kinko's almost bought 700 TT's? It certainly wasn't to run EdHak! One
wonders if Atari HQ has heard of Calumus!

>size of the disk portion of MTOS was? About 800k. Less that 1 disk. THAT's
>compact, folks. Optimized code.
>

Ah, but let's be just a little fair. MTOS doens't have some of the things that are in those bloated releases. Those incredible NeXTSTEP sizes are due the the plethora of programs (and not all cheapys either...though you know that as you have used one!) that come with the release. Part of the OS/2 bloat is the code for Windows/DOS emulation...and some demo programs as well. (Notice the carefull non-defending of Windows and NT!)

Not to mention Fonts. Does the disk contain any fonts? System 7 does take up something like 6 disks or so, but if you remove some of the unneeded control panels, keep the fonts to a minimal level, you can make a SYS 7 boot disk to. I'd hardly call Sys 7 "optimized code". Apple does give alot of nice toys away with OS realeases...like Apple Remote and Quicktime. More toys and printer drivers is not something that *I* complain about!!

I'm sure the Amiga people think it's funny to. They say the same thing about the Amiga OS...you can easily put it on a few disks as well.

I'm not saying this to rag on you..but to point out that if small size of MTOS is lauded, it be held into the light of a more reasonable comparison. Even so, MTOS comes out as compact, and surprisingly full featured for all it's compactness.

(I hope this is non-volitle enough for a non .advocay post. if you don't think so, mail me and tell me!!)

] Ha ha. You mean that slow, ugly non-Gem thing with no vt100 emulation at
] and menus that look like Atari 8-bit Basic? Like pick a key for the first
] letter of a command? Oh god.

If you don't like it, no-one is forcing you to use it, there are plenty
of people who like it.

Considering it was written in his spare time whilst Aaron was sorting
out his exams etc., I reckon it's a pretty good job!

] Oooooh, aaaaaaah, like several other programs have been doing since 1986?

So, it hasn't had VT-100, but it has plenty of other stuff that those
'86 programs never had!

BTW - I can't see how you can call it slow, it's certainly a helluva lot
faster than Rufus, and Connect on this machine! Resolution independant
as well! (Works on the TT). overscan or some such things let you
have larger terminal screens etc. GEM is slow as it is, why do you think
Warp-9 was written? The only difference such programs make to FZT is
text re-drawing! Screen swapping is virtually instantaneous, which
sure ain't slow!

I don't want to turn this into another FZT Vs Flash argument, (as each
is best for the users who find it as such). But, try not to be so
negative!

5942. ST running at 38400 buad?

Newsgroup: comp.sys.atari.st
Date: 1993-04-24 03:49:08 UTC
From: swhatley@blkbox.COM
Message-ID: <1993Apr24.034908.23959@nntpxfer.psi.com>
Source record: 207021

I have a Mega 4 ST running TOS 1.3. I have just bought a Trailblazer T1600 modem which has V.23 bis with V.42 error correction. It allows me to transfer files at a rate greater than 19200 buad. Is there a way to allow my ST to run at 38400 buad? Any help will be appreciated.

Thanks,
Steven Whatley
Email: swhatley@blkbox.COM

] Myself, after hating Windows 3.1 for so long, am looking forware to NT,
] its got quite a bit in common with VMS, like the task scheheduling,
] event flags, and others. I dont think itll be much like Unix, tho...

A fried who went to a M-Soft showing the other night, had all the NT software talked about (and plenty shown), as well as DOS 6.

Apparently, Windows NT needs at least 30meg of Hard-Drive space to operate in! (I don't know about this, it's just what I've been told via said friend by a Micro-Soft employee with Windows NT on his HD that he had with him)

Sounds like typical Micro-Soft badly written code to me. (Although, very little on the IBM is compact code, due to the assumption they all have HD's, and can fit the large code onto it. And the support for CGA, EGA, MCGA, VGA, SVGA, Herv' etc, and Tandy, Soundblaster, PC-Speaker etc. sound. ^c

You end up with hundreds of files, and very large software!

(Someone had some Sierra software on the PC, about 100 files compared to about the 18 of the Atari version.)

What the heck, they must have done something right!! Else why are there so many of the things around! :)

Heck.. DIAMOND OS on the Atari 800 fits into one cartridge..!

So it MUST be better than MTOS, right..?

Let's ignore that it doesn't come close to the functionality
of that "bloated" MTOS...

Likewise...

MTOS fits into 800K because it does so much less than the
other guys...

5946. HD backup

Newsgroup: comp.sys.atari.st
Date: 1993-04-24 06:35:58 UTC
From: tpars@codewks.nacjack.gen.nz
Message-ID: <N3RJ3B2w165w@codewks.nacjack.gen.nz>
Source record: 207035

I've just started using the DVT(tm) VCR HD back-up system(v1.15) from Seymor/Radix (Toad:$69), and love it - with qualifications.

I'd write S/Rad in TX direct, but it hardly seems worth the postage just to find that they don't exist anymore - copyright on the manual is 1989. Or I could ask Toad, but that's also expensive from here. And if S/Rad *does* still exist, they deserve some publicity for a very useful product.

It lets me back up a full syquest 44 disk onto a videotape (drive by drive or file by file) and recover the files singly or by drive or all together. I can now archive tons o' stuff that belongs in the electronic attic and transfer massive things from one 44meg cartridge to another, besides feeling secure about my data.

BUT... there had to be a but, didn't there..?

The backup program starts out with a self-test which informs me that something's wrong with the plug-in cartridge, the VCR, or...? and that I should proceed only with great caution. I did, and everything works fine except for occasional harmless lockups which require reboots.

This is on a 1985 1040STF with 4Meg RAM (from the Zubair DIY kit - which I found *hellish* to install,coupla years ago), still running TOS 1.0, usually with the SM124. On the one hand, this feels like the best buy I've made in years, glitches and all. OTOH, it would be nicer *without* the glitches.

Ideas? Experiences? Does S/Rad live yet? Thanks.

Tom

>Would it be possible to have a windowed display? What about image scrolling
>using the mouse?

Well, I'm glad I figured it out for you, I thought the "strobe" flickering
was weird. A few bucks would help.

As far as a windowed display, I'm not ready to impliment that, especially
since I flicker the screen, this would be slow, look weird with windows, I
think.

You should read the docs THOROUGHLY, because in them they tell you how to
scroll around the screen with the mouse. All you do is move it in the
direction you want to scroll, and it will scroll until you move the mouse
back to where it was when the screen wasn't moving. You can't see the
mouse, but it's easy to "feel." The farther you move it in a certain
direction, the farther the screen jumps as it scrolls. This is kind of a
weird scrolling system, and it takes time to get used to, but I like it
the best of all the ones I've seen.

5950. Decent QWK-readers for ST?

Newsgroup: comp.sys.atari.st
Date: 1993-04-24 12:13:52 UTC
From: paetau@mits.mdata.fi
Message-ID: <1993Apr24.121352.7481@prime.mdata.fi>
Source record: 206888

I have tried many QWK-readers, but none have satisfied me. MT QWK was maybe the best of those I tried, but it was instabile and bombed at certain things. Particulary the newer version, 1.10a, was instabile. I also tried CQWK and Red Wine reader. I have heard of Maximiser and something called IMHO, that is supposed to run only on 1MB machines. I'd be interested in hearing wherefrom to get these two, or maybe something else that is good.

Oh come now, NT is a mainframe class operating system; its going to run
on Intel crap boxes, as well as MIPS, HP, and the Alpha chip (on the
Alpha, your talking about replaceing VAX 6000s with AXP 7000s running
NT). Of course the code is going to be large.

I have a VAXstation 2000 on my desk, running VMS 5.4, and VMS takes up
80mb of disk space. This is the same OS that runs all the way up to
VAX 10000s.

NT and VMS are written by the same person (I read this in Digital News &
Review), and this person also wrote RSX-11 and others, so I may retract
my statement about MS writing bad code.

HI Michel..

I do have a Copy of ST-Fax, its all in German, and I think in mono,
and I think there is OSF GNU Fax, I think this mention on one of the groups,
I think the comms one..

tu-berlin.de has a file with mention of Fax and so does GEnie..

Source record: 207034

Hi,
I'm planning to connect a second MEGAFILE to my 520ST+. The manual
says "The DIP switches in the second hard drive must be reset so
that your computer can recognize it. Take your drive to an authorized
Atari service center to have the switches reset."

I'd rather do it myself, though. I haven't opened my drive yet,
but can anybody tell me which DIP switches must be reset?

Thanks very much,

I've also had some disappointments - but is it due to which computer & TOS we
are using? (i.e. the "Cuddly" Demo does not work on my STE properly).

>my statement about MS writing bad code.

The guy who wrote VMS should be shot. I can't stand VMS. The only thing
I do with our VAX/VMS system is send mail/messages and rlog into a
REAL OS like Unix.

Give the guys at ATARI credit, at least they TRY and keep the OS size
smaller while still getting a nice amount of power out of it.
Heck, most of the OS fits into 256k ROMs and Multi-TOS fits onto a disk.
Now, if you'll remember correctly, Multi-TOS evolved out of MINT which
is alot like Unix (which is a LARGE OS).

Well, that's my 0.34656253 cents (with an uncertainty in the 43rd
decimal place :-D)

>Later versions certainly will, just as soon as I get the code working (why
>is there so little publicly available NeXT DSP code?)

To answer your question, I think most people using the NeXT DSP are using it for data acquistion or for projects for DoD where they can't release the source.

Anyway, there are some excellent examples. For general DSP code you can call the Moto BBS (if it's still up ... I think they might have took it down!). Here's the info on it:

The V.22bis -2400 baud number is (512) 891-DSP3
Format: 7 data bits, even parity, 1 stop bit
User ID = guest

There is a great 56001 DSP Manual (more than just NeXT specific) at ccrma-ftp.stanford.edu in /pub/DSP.

And, as for source, how about the entire NeXT MusicKit and DSPTools (sans low level drivers)? It's being upkept by CCRMA of Stanford and the source is available. I think the address is the same as above. Or, since it's not exaclty small, you can join BANG for $35 and get it on CD. If you want I can send you CCRMA's release which details all of this (it's just much to long to post.)

And though it doens't directly use the DSP, the NeXT program Loochine does use it throgh system calls. It shouldn't be too hard to port it as a test program...and it's fun in a silly sort of way. Drives my cat nuts!

Don't ask me about any specifics...I've not develed into my DSP yet!

^^^^^^^^ ^^^^^^^

you got it right, here !

>MultiTOS and are now working on more drivers. Who knows.

>Erlend.

Atari has always been slow to come up with updates for their OS:
1.0, 1.2, 1.4, 1.6, 2.06, 3.06, 4.01 between 83 and 93 !!

Of course, you'll say that there's been more (2.05 f.ex) but I'll just
answer that 1.4 and 1.6 are the same, just like 2.06 and 3.06 !

THe main Genlock producer for the Atari systems is JRI Industries. I own the Mega ST Genlock. I know they have one for the Falcon. You might want to call them and find out about compatability with the TT. The number is 510-458-9577

I have no further communications.

>trying to put together a 32-bit screen chunk.

Are you serious ?
Do you mean you're convinced your Falcon is only putting pixels on the screen ?
Don't you know that all pointers are 32bits and (even worse) that instructions
can be advantageously read 32bits at once ?

Even with your 'exclusively graphics' application, I'm convinced a 32bits
access to memory would give you more than 50% speedup !!

Or you can get an Amiga 1200/80 meg for $868.00
or Mac Centris 610 for about $1600 street.

Both are available today and at any hour, minutes and seconds....

Later...

Amiga 1200/80 megs- I love it..

Source record: 207049

I got ZOO.TTP from umich recently and had the same problem.
Found out that "zoo -extract archivename" does work. (That's
the "novice" form of the command.) ZOO _is_ defect, but this
is a way around the problem for now.

LHARC seems to be an old version, it SAYS "beta", it works but slowly.

The programs that seem to be do-it-all un-arc-ers are really just
shells, you still need the actual ARC, LHARC, ZOO, etc programs.
If somebody knows of a true multi-format de-arc-er please tell me.

Personally, I wish we stuck with ARC521 way back then...

Other bug reports: POMPEY is VERY slow and the executables I packed
sometimes bomb. Too bad, it makes them HALF the size! PACKER seems
to work fine although it does not pack executable quite as small.

All the Kids-Games are for low-resolution only. I wish that was mentioned
in the index. If anybody knows of good educational games for a 5-year-old
that work in monochrome hi-res please tell me. Thanks.

5971. Atari SLM 804 Laser Printer for sale

Newsgroup: comp.sys.atari.st
Date: 1993-04-24 22:15:11 UTC
From: dmeggins@aix1.uottawa.ca
Message-ID: <1993Apr24.221511.4814@csi.uottawa.ca>
Source record: 207048
Cross-posted to: comp.sys.atari.st,ott.forsale,ont.forsale,misc.forsale.computers

Thank you to everyone who responded -- I have sold my Atari megafile 30
and agreed to sell my Minix for the full asking price.

Now, I have the biggie for sale, since it has just been given
a clean bill of health by my local Atari dealer.

The Atari SLM804 laser printer is a very fast (up to 8ppm) heavy-duty
printer, the first laser put out by Atari. This one is about 3.5
years old, and has had one new drum installed (about 1000 pages ago).
It requires at least a 2MB Atari ST computer, and works very well
with Calamus. The computer comes with all necessary cables and
the original software (emulating a Diablo printer) -- there is also
free software on the net to emulate an Epson for wordprocessing
purposes, and there is fairly cheap software for Postscript emulation.

PRICE: CAN$500 (I will pay shipping within Central Canada)

For more info, please reply by private mail, or phone me at
(613) 567-7884. I promised someone down east to tell him first
when I was selling this, but I lost his address -- if you are
reading this, reply within 24 hours and I will give you first dibs.

David Megginson

> > Unbearably slow on an ST (it takes a LONG time just to move one square)
> > and incredibly red (I'm not sure why... _all_ of the graphics have this
> > gross red tinge).

Surprisingly enough, I managed to get two email flames about that
posting... Odd.

Allow me to rephrase my _opinion_ about Ultima 6 on the ST:

It is incredibly frustrating to play due to the intense slowness.

On a TT, it's great. Yup, they did the port right, not only is it
hard-drive installable, it runs on the TT. Maybe it'll run on a Falcon,
where it'll also be nice and playable. IMHO, it's not playable on an
8Mhz machine.

Apparently some people would rather I didn't point that out; I'd rather
have people give it a second thought before plunking down their $60 or
whatever.

There's one in every crowd..... I've found that the people who don't
like VMS are the ones who can't understand it. It has a certain
elegant-ness about it that other OS's that I've used haven't come even
close to having..... but then it's designed for people (non
programmers) who have things to do, not for those who want to hack.

>I do with our VAX/VMS system is send mail/messages and rlog into a
>REAL OS like Unix.

Careful who you say that to. VMS is a very real OS that earns more
than a few of us a decent yearly wage.

>Now, if you'll remember correctly, Multi-TOS evolved out of MINT which
>is alot like Unix (which is a LARGE OS).

I'm not too sure MiNT is very Unix-ish. It just happens to be written
so that Unix utilities & tools can be compiled to work with it. More
of a tribute to Eric Smith's skill at designing an OS.

What you are talking about are the ports of various styles of unix
shells.

I'd love to have a DCL compatible shell for MiNT or MultiTOS
How POSIX compatible is MiNT & MultiTos ??

Unix itself is actually quite small...... its all the add-ons that
make it bloated.

Guess I'll stop for now..... debating VMS vs any variety of UNIX is a
waste of time. Sort of like comparing any of the OS's that run on IBM
minicomputers (other than AIX) to OS/2. They're not the same type of
animal.

Toad Computers
556 Baltimore Annapolis Blvd.
Severna Park, MD 21146-3818

(410)544-6943
(800)448-TOAD

Ask for catalog.

BTW, there's something I don't understand. Toad is currently saying in their ads that they're taking advance orders for Falcons (i.e. a waiting list). Now, Rehbock said in some online conference recently that there will be NO mail-ordering of Falcons. 8^} Looks like somebody is in for a big surprise.

Source record: 206908

*** Copy of Article that was posted to comp.sys.atari.st on the 16 April 93...

Keywords: EPSS SYNTH SEQUENCER CUBASE MULTIMEDIA
Lines: 34

Are you a musician?
Are you working with MultiMedia?
Or are you just interested in music?

Then EPSS is something for you!

EPSS is sample synthesizer that runs on any STe, MSTe, TT or Falcon with
at least 1MB of memory. (2 or 4MB of RAM recommended).
In standard configuration it plays 8 voices polyphonic at 25KHz using the
8 bit DMA-sound engine. A Falcon version is under work that will utilize
the Falcons sound engine.

EPSS can load midi-files and play them, or it can hook itself into
most of the common sequencers available, and be used as a synth.

It has been uploaded to atari.archive.umich.edu and ftp.uni-kl.de and is
called 'epssatom.zip'. The archive was packed using ST Zip 2.2.

Enjoy!

>operate in! (I don't know about this, it's just what I've been told
>via said friend by a Micro-Soft employee with Windows NT on his HD that
>he had with him)
>

30 megs? I think not. Installing the Beta on my 4/66 at work ate up 85 megs
of hard disk space. 16 megs of RAM was barely enough to run it! Running any
DOS programs [read: X Wing ;)] is slow as hell. Reason: The wonderful
virtual '86 mode. A smooth as silk anim turned to a 4 frame animation that
sent a sprite accross a 17 inch monitor. 4 frams! Eck.

It's nice. It's powerful. It's $500.

Verdict: If you're not on a network, don't even bother.

Check out the system Mac Hardware..I am sure users have posted the MacWeek articles...These Machines will be hot. Cyclones will be shipping in June.

The cyclones have been dubbed the 'Mac111"

New archetecture like nothing you will have seen...These will be rich in features...Such as:

Dual DSP's for sound and video. ISDN for live video. Be able to directly hook upto camcorders, VCR's and other video equipment.

Two Cyclones..

Tempest cyclone: Same case as the Centris 610 with 25mhz 040..Will cost $2500 and up.

Cyclone 11(Quadra 800 case) 33 mhz 040(40mz. maybe) Will have losts of expansion...

Later...

>
>Commercial, Shareware, or Freeware.
>

Although it can't handle "arbitrary depth", my personnal favorite is
Neochrome Master. It can even handle Spectrum type pictures, and does
anti-aliasing, and a whole bundle of other things !!! And you can save
your bitmaps in any size in "bitmap files" (The layout is described, so
you can use them in your programs) In fact, there's so much stuff, I
don't remember half of the features ! (Haven't done much ST'ing lately)
And you can specify the size of the real-time zoom, so you can single
click pixels all you like ;-)

Patrick.

5982. Gemulator

Newsgroup: comp.sys.atari.st

Well, if you are just an average user, you will not be able to afford
an expensive monitor anyways, so any resolution that is higher than
800x600 will be useless to you. Since the Falcon allows displaying
800x608x8bit by hacking the (undocumented) video registers (and
changing the appropriate negative Line-A variables), this will be all
you need. OK, this resolution will decrease the refresh rate to
slightly more than 50Hz, but it is still a very useful mode --- in
fact, I am using it right now.

On the other hand, if you are a power user, who spends about $1000 on
a 17" monitor, then you will easily be able to afford a ScreenBlaster
or any similar hardware, that allows you a megapixel display. These
devices cost just about $100, so that should be OK...

From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1re279INNrgf@golem.wcc.govt.nz>
Source record: 206919

Well I just had a Play with ConNect in ST Mono mode, after finding that its usless in ST medium res mode.

Well from what I can see of it its not worth a cent, the window is far to small and the program seems a little bugy, it did not save the conn0.set file the first time I tried, the Text in that mono mode is far to small..

Also no background dnload with gzrzacc at all, I was informed that if I had gzrzacc version 3.xx it would dnload in the background, NO IT DID NOT..!!

PLEASE can some one produce a decent comms program for the Atari, I am still waiting, or do I have to buy a PC clone..??

On a PC VGA, no way. They emulate 640x200 by doubling each scan line, just the
way Falcon 030 does it when hooked up to a VGA monitor.

And the SCxxxx monitors don't quite like 31,5 kHz...

> if you got a faster FPU...)

Modelling programs like CAD-3D would be awesome in a Falcon-specific
version... it uses all fixed-point math. I have a feeling that
converting POV-Ray to use the DSP and fixed-point math instead of
floating might be a painful exercise... then again, I haven't looked at
the code much, just compiled and ran.

Lexicor will probably come out with nice DSP renderers, but Phase-4 is
just a bit steep for a hobbyist. :-(

Ahem. I'm a tech writer; you can trust me when I say that no matter
how good a UI is, there will _always_ be features that the user will
miss or that aren't easy to figure out. These days a good manual is as
likely to sell a product as good software is.

How many times do we have to point this out? It's not the mid-80s
anymore; _trying_ isn't good enough! In the face of polished
applications like Claris Works that actually have:

a) the support of the company who wrote them (1-800 number, no?)
b) upgrades (we'll see if AW ever gets upgraded)
c) A MANUAL

AtariWorks is an oddity that only a few people will ever give a second
look.

Like I've said before, I work on LONG documents all the time... I'm a
professional writer. I wouldn't want to use PageStream or Calamus for a
book, and everything I've used on the PC has been hellish...

When Calamus does PostScript, I might consider it for small documents...
I'd hate to have the LaserJet IIIsi go to waste.

I've had the ESC key on the desktop problem ever since I had TOS 1.4 installed in my STf and the memory expanded to 4 MB. I always have to close the GEM window for drive A: and reopen it if I change disks; if I press ESC, I get an immediate re-boot.

Hey if you can't stand the heat, get out of the kitchen...
People who can't hack undocumented video registers and Line-A
variables don't deserve 800x608x8bit. Friggin' whiners... Those
are the kind of people who go around worshipping John Sculley's
butt vapor. Sheesh, when I was their age all I had was an Atari 800
and a secret 160x192 16 color mode and I WAS GRATEFUL! :-)

But seriously, you know as well as I do that there will be a P/D utility
to set this mode out really soon... Of course, the chances of me buying
a falcon are pretty slim, but I can still think it has some neat
features...

Toodles...

I learned to use MS Word on the Mac w/o the manual, because of it's extensive
HELP facility available from the menu bar. I can't say the same for 1st Word
or 1st Word Plus, or any other ST package I've used; perhaps that's deliberate,
to discourage piracy. With sufficient disk space, manuals can be superfluous,
but software vendors may feel uneasy about that approach...

>BobR

OK, you are right; you can probably not expect the "average user" to know, how to hack the video registers, but he could still ask (on the net) for a program, that does this hacking. I can understand that people criticise Atari's decision not to enable these enhanced video modes by legal system calls, but on the other hand, these modes will definitely cause damage to a VGA monitor, even though they work perfectly fine on an SVGA monitor, thus the "average user" could accidentally destroy his VGA monitor if he selects a higher resolution. Thus Atari's decision makes sense: if you want 800x600 you can do it, but then you should know what you are doing, otherwise just stick to 640x480, which is fine on any kind of monitor.

Markus

6011. A few Qs

6012. Re: MiNT 1.04 problems

Newsgroup: comp.sys.atari.st
Date: 1993-04-25 21:24:35 UTC
From: jeffmay@magnus.acs.ohio-state.edu
Message-ID: <1993Apr25.212435.10050@magnus.acs.ohio-state.edu>
Source record: 206938

I also had problems with MiNT 1.04 crashing before reaching the
desktop--it turned out that combining MiNT 1.04, the Minix filesystem,
and an early version of AHDI (version 4) was causing the problem.
After replacing AHDI with a more recent version (5.0), the problem went
away. (Thanks to Geoffrey Noyes for suggesting this--I tried to e-mail
you a thank-you, but it kept bouncing).

Since there were a number of people having problems with the ESC
key updates, follwing is a repost of the fix:

Try adding one line to the function tos_dskchng() in TOSFS.C:

```
New> if ( (ti->attr & FA_DIR)==0 ) /* NOT a subdirectory */
while ( (f = nextf) != 0 ) {
nextf = f->next;
f->next = 0;
}
ti->open = 0;
/* if there are any cookies pointing at this name, they're not
* valid any more, so we will *want* to get an error if they're
* used.
*/
```

and the problem should go away; without this fix, tos_dskchng() occasionally
(depending on TOS and Desktop versions) overwrites system vectors.

This fix is from Martin_Koehling@un.maus.de

When I called a dealer asking about upgrading to a TT (from my 1040STe), he told me Atari no longer made the TT's because they were coming out with a faster (040) Falcon...was he delerious, or has anyone heard about it?

I'd have to agree that a 68030 machine is fine and dandy, but let's be reasonable, there needs to be high-end machines in the works and Atari just is too late too many times...

That would seem to be the case.

Also, for those people who are whining about how much they
like GEM, there is always the original DRI GEM which has
improved at a much faster rate than the bastardized version
produced by Atari. Then you can migrate over to cheap
intel hardware and keep the same (relatively) interface
you've grown to love/hate.

Cheers,

Chris

I'd be curious to know just how many of those things they even
sold. I wonder if it is more than the ill-fated ABAQ?

In all seriousness, they probably don't have the resources to
support more than one or two machines (two at best) so I'm
not surprised to see the TT discontinued.

These bozos take such a huge hit on their inventory each time
they report earnings, one has to wonder that they do with all
the semi-worthless parts and equipment every year.

Skoal,

Chris

6019. Customer Satisfaction!

Newsgroup: comp.sys.atari.st
Date: 1993-04-26 00:27:58 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <25APR93.20275874@cc4.crl.aecl.ca>
Source record: 206945

The following is the text of a FAX I sent to Atari recently:

==========
To: Bob Brodie
From:Greg Csullog

As Director of Communications (I believe that's your title), would you
please review the following copy of a FAX sent to Atari Corp on
April 23rd? Is Atari having trouble contacting me? As far as I know,
no other supplier has been unable to provide me with basic information,
such as "when can I expect to receive my order?" or "has my order been
shipped?"

Would someone at Atari please FAX me info about my order for a 4meg
TT RAM board and for a case for a 1040STe. My customers are getting
somewhat p*****d off at the delay!
==========

I sent the above FAX because I had been unable to get anyone at
Atari to tell me the status of an order I placed almost a month
earlier. My customers were getting impatient (in my FAX I put
asterisks, I did not spell out the "p" word) and, once again,
here I was having to beg Atari for basic information that would
help me sells ITS products. I had sent three FAXes to Atari
asking for the status of my order, prior to FAXing the above
to Bob Brodie, and no one at Atari replied to me.

Bob Brodie's response to me (which incidentally did NOT include
answers to my questions) included the following:

"The intention of the fax appears not to be simply an attempt
at getting answers, but also to be insulting and inflammatory.
If you had written to me with that tone, the fax would go to
the bottom of the pile. I might add that the pile is rather
substantial, and it would be a prolonged period of time before
you would hear from me".

Jeez!, try a little prodding to get info out of Atari and you
incur the wrath of Bob. Obviously his backgound in communications
did not include any discussion of customer focus (as a dealer
I am Atari's customer) or diplomacy. Since when did the use
of the phrases like "please review" and "please FAX me info"
constitute insulting and inflammatory dialog. And yes, Bob,
as your customer, it is within my rights to state that I do
not have similar problems with other corporations - sorry
if that strikes too deep at the heart.

Atari damn well better start treating its dealers with a bit more respect than indicated by Bob's fax to me or it can forget any hope of a recovery or survival. No doubt, because of this posting, I will probably see even worse service out of Atari (if that's at all possible!)

An Mr. Mihoka, don't say I told you so. I have had nothing but headaches dealing with Atari (Canadian and US offices) over the last 4 years - it is only stubborn determination to promote Atari hardware (not the corporation) that has kept me in the Atari camp.

You might be right and the author might be wrong. They listed it as MultiTOS 4.0, but I would imagine that it is 1.0.

Than again, Microsoft will market Windows NT as Windows NT 3.1. Whatever happened to V1, V2, and V3. Maybe Atari will do the same...<g>

Best Regards,
Mark K.

Obviously you were not able to read the manual - its still in german
and this will excuse your strong statement. There are lots of people
working in mono mode in CoNnect having 24x80 character size windows
with appropriate font sizes.

Anyway, when you cal CoNnect buggy, I want to have a better description
of a possible bug. CoNnect has the by far best an bug free emulation
avaiable on the ST. Where - I really ask you - did you find bugs?

>Also no background dnload with gzrzacc at all, I was informed that if I had
>gzrzacc version 3.xx it would dnload in the background, NO IT DID NOT..!!

Of course it does. While downloading you can still work in CoNnects
Unix-like Built-in shell named Coshy. You may not call screen blocking
applications but downloading in background - as far as GEM allows background
tasks (Accessories) works fine. Which version of GSZRZ.ACC did you
actually use?

Wolfgang

I would have to say that it has been more than just you that has problems with Atari. I hear that Mr. Brodie has a long list of enemies. I would say that if you want something done, don't leave it to Mr. Brodie. I have heard of other people getting some "uncaring" responses. Send your FAX to someone else other than Brodie...

Good luck, things are really hopping at Atari, there seems to be rarely anyone around to talk too.

Congratulations, Greg...

Welcome to Bob Brodie's "list"...

In addition to your service from Atari becoming even worse, you'll now also have the benefit of having Bob joke about you on GEnie.

Incidentally, his "background in communications" consists of driving an armored car.

This is how a professionally run company deals with its customers, and its dealers.

I'd suggest that you FAX your story to the President of Atari Corp., but one guess who'd get it.

BobR

By ED floppy support, do you mean that there are atari machines that can
connect to 4Mbyte (2.88 formatted) floppy drives. What hardware/TOS combination
is required for this?

Hmmm....
I think the reason is that for MiNT >= 0.99 and especially for the filesystems things have changed a bit (Eric explained it in this group). Recompile the XFS with a new MiNT lib. (I have PL 30).

You definately need an AJAX floppy controller since there's no way you
can get a WD1772 to accept a 32 MHz clock-input (which I think is needed
to be able to r/w ED disks). In the MSTE/TT/Falcon you can software-wise
toggle the clock-input between 8 and 16MHz (DD and HD), but I don't think
there's a way to feed the FDC 32MHz from software (not really sure about
the Falcon though). What you need is a simple hardware-hack. :-)

Also, as far as I know no current TOS-version supports formatting of ED-
disks from the desktop. Writing your own formatting-software shouldn't
be too hard though...

} Exemples: Virtual Memory (No), Pallete Management (No), New Filesystem (No)
} Split Loading (Loading only the parts of the program that are needed)
} Etc, etc, etc...
}

Hmm. New filesystems it has in a *very* elegant fashion. Virtual
memory is not present (yet!) I agree, but shared libs are underway -
although not available yet. As for Pallete Management - that's a
windowing systems job, not an operating systems job; look at X.

What it has got are multi-threading, shared memory, pipes etc., multi-
user ability, and a clean programming interface.

There are obviously priorities in developing a new operating system,
and I dare say that Eric is doing his best to get a stable platform
out to atarians before adding all the goody bits on. MultiTos is disk
based so upgrading it oughtn't be a problem. There is also the problem
that NT doesn't face - that of trying to implement the system on <030.
(Imagine an 8086 running NT - after all the 68k was out at about the
same time!)

As an aside, I read in a magazine that NoT took ~10 man-years work to
get to it's present state.

6039. FALCONS at MIDI Music Show in UK

Newsgroup: comp.sys.atari.st
Date: 1993-04-26 11:40:23 UTC
From: thumpy@dcs.qmw.ac.uk
Message-ID: <C639rC.HK7@dcs.qmw.ac.uk>
Source record: 206863

I popped along to the MIDI & Electronic Music Show last Friday, and I have to say I was very happy to see the level of support for the Falcon there. Highlights included:

Harman Audio demo'ing Cubase Audio - running 8 tracks of digital audio of the machine @ 44.1KHz sampling rate (they use an external clock to generate the 44.1KHz frequency - it'll come with the s/w). The software displays audio on-screen along with MIDI sequence tracks. It can also use RAM either as a cache to make up for a slow (ie not blindingly fast) hard disk, or as a simple sampler. Each audio track has an effect send, but don't expect pro-quality reverb, cos the DSP is quite busy routing the audio already. Steinberg see the product as NOT pro-quality (it is limited by the Falcons A/D and D/A converters - they may release a higher quality 2in/2out board depending on demand) but as a VERY GOOD introduction to hard - disk recording. Release predicted: June/July.

Compo Software (?) did a BIG push for the Falcon - demo'ing Cubase 3.0, their FX processor s/w and the Tina Turner video/audio demo. "This is the future of music computing..." the man said.
They also showed off a very nice drawing program, running in 256 colours with German menus... looked powerful, but I have to say it looked a bit slow when compared to my (humble) Mac II running various packages.
They also advertised their Falcon Tower - a big box to put your Falcon motherboard in and plug in a PC keyboard.

ABC Music and another dealer I can't remember had D2D's 4TFX and 2-Track hard disk recording programs - they look OK, but the UI could do with some work. Compared with Cubase Audio's lovely custom windows, poor old GEM looks, well, crap. One advantage the 4TFX program (4 Track recorder) should have over the Steinberg software is it's predicted external hardware giving 2 high quality A/D converters, 4 D/A converters plus digital I/O.

There were still loads of ST's around as well. I'd say Atari outnumbered other all other types of computer at the show - Macs were few and far-between but PC's seem to be getting more popular. What a horrible thought...

> upgrades (we'll see if AW ever gets upgraded)

Well, I recently learnt from Atari that AW 1.5 and 2.0 were already planned. Of course I am not sure that these will also be given away for free with Falcons with HD's. They told me, because I asked for some features that are not present in the current version, but these are planned for the future versions. I cannot go into further detail, since Atari may always change their product specifications.

**** Help with MIGRAPH...****

I have been trying to get my Copy of TouchUp upgraded,
I contacted MIGRAPH-TECH on GEnie and did get one reply,
I left them my address but never go a reply or any mail from them,
I left 2 more messages on GEnie, but still no reply..

I have since mailed to them by post but still no reply, to there new address,
well I think it was..

So is MIGRAPH sill around or do I forget about my TouchUp upgrade..??

Gee why in the hell did I by a Atari, the support stinks..

So, can some one Please let me know if MIGHRAPH is sill around, if so
could you give me there new address and phone number, Please not a 800 number..

Thanks.....

As more people may have the same dilemma, I am posting this to the net.

neurom@u.washington.edu (Neuromancer) writes:

>1) Upgrade my ST to:
> 4 Megs RAM
> TOS 1.4
> 120meg SCSI HD w/ ICD+ clock Host
> Add NeoDesk 3.0, Universal Item Selector III (?), and Warp 9

Well you would also need a faster processor so add a few bucks.

>2) Get a Falcon030 as a 4/65 config and add an external SCSI II 120 meg HD.

Definately the best option. You get Speedo GDOS and Atari Works and
MultiTOS for free with this system. An estimated value of $250.

>3) Get a Falcon030 as a 1/0 config and:
> Get a RAM expansion board
> Populate said board w/ 4 megs ZIP RAM
> Get Internal 120meg Maxtor HD

You will probably not have enough room to add both the ZIP ram and a
120 Meg 2.5" disk in the Falcon. Using the Matrix chip lots of programs
will likely be more harddisk intensive than ram intensive. So the exrta
speed an external SCSI disk provides and the extra space the internal
disk provides make the second option the best for you I think.

If you have OS in ROM it is more economical have fewer updates. And we
already are confused with this amount of TOS versions, so I think it is
quite good we have not that many. Of course I also wish that Atari
corrected some bugs earlier on.

>Of course, you'll say that there's been more (2.05 f.ex) but I'll just
>answer that 1.4 and 1.6 are the same, just like 2.06 and 3.06 !
1.4 and 1.6 are not the same. 1.6 has a few bugs removed and supports
cookie jar and the dma sound.
3.06 is 68030 optimized if I am correct. 2.06 just has 68030 support
but is not optimized for it.

>Calamus is not an effective gem program because it is not intuitive?

Did I say gemprogram != manuals?
Did I say forget the manual, push some buttons?
Did I say Calamus is not an effective program?
I don't think so.

One of the great things about a GUI is that the basic interface
remains consistent from one program to another. Basic operations like
loading and saving files are usually done in the same way - if a
program does not allow this then it's defeating at least part of the
purpose of a GUI. Beyond this level I would agree that you often need
to read the manual, although it is often possible to make an educated
guess about an operation given the visual feedback of a GUI. I don't
think that it's actually 'lazy' to try things first and then look at
the manual -especially with a program like the one I was mentioned in
the original post, the wp part of Atari Works.

I don't see why an internal 120mb harddisk (2.5") should consume more room
than an internal 60mb harddisk of the same form factor. In fact, I know
a developer who *has* a 120mb Quantum drive in his falcon.

Sorry, but your serious doubts are unfounded :-)

STalker relies on nothing more than GEM's cooperative multitasking to perform in the background. When you run a non-GEM application you cut off event processing, but otherwise the operation is generally quite smooth. Any Mac or MS-Windows background-capable comms package would use similar techniques btw since all three systems use cooperative multitasking.

6056. Sound problems on new TT

Newsgroup: comp.sys.atari.st
Date: 1993-04-26 13:18:44 UTC
From: scott@dmi.stevens-tech.edu
Message-ID: <1993Apr26.131844.3871@dmi.stevens-tech.edu>
Source record: 206876
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello all,

I have the following hardware problem. I recently put a new TT
into a German tower case made for holding a TT. After instalation of the
TT motherboard and all my drives the machine booted and worked fine.
The problem is that I managed to screw up the sound subsytem. I get no
keyclicks, bell or any audio.

I though the problem was the Yamaha chip as the tower case comes
with a front mount reset switch that clips a lead to the Yamaha. However
I replaced the yamaha chip and still no sound? Does anyone know how I can
go about finiding out what the problem is? bye the way I also get no ouput
from the two RCA jacks at the back of the machine.

Altough I do not use sound that much it is anoying to me that I
have a nice new TT with all the trimmings but a broken sound subsystem.

Cheers,
Scott. "scott@dmi.stevens-tech.edu"

This one is too good to pass up (from the guy who's been predicting the imminent bankruptcy of Atari for at least 3 years).

DRI has been gone for about a year now. The pieces belong to Novell, who are continuing development on DR DOS, but not GEM. Before that, the last time DRI updated GEM was about the time the Mega ST came out (GEM 3). And at that it wasn't really an improvement, more a patch to keep out of Apple's way on copyright disputes.

TTFN, Chris

Well. The most common reasons for 'no sound' are: (1) speaker not connected properly, (2) one of the DIP switches was changed. You might want to verify that :-)

6061. compiling MiNT 1.04

Newsgroup: comp.sys.atari.st
Date: 1993-04-26 14:57:57 UTC
From: azog@world.std.com
Message-ID: <C63Iwn.Hnv@world.std.com>
Source record: 206884

Whats the deal with compiling MiNT 1.04? Anything special I should know? I have GCC, and the GCC libraries, and also the MiNT libraries for GCC, along with GnuMake. All of which I snagged off umich, along with MINT104S.ZOO

So I un-zooed everything, and in the mint.src directory created was a makefile, so I typed MAKE, had some coffee, and about an hour later, it was sorta finished. THe only thing the makefile didnt do was strip the symbol tables (since I dont have a strip.ttp), and chmod to 777 (which I did by hand). Placed MINT.PRG in C:\auto, and rebooted.

Seems that firstly, the CNF file has changed, since my CNF from 095 had a HARDSCROLL statement which it blew up on. So anyways, I fixed most of the CNF statements, and now, MiNT just pukes, and exits with an error code of 65502???

Any clues? Thanx

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...just wish unix would have the file-generation setup like VMS
(i.e. keep backups of every older version until you decide to PURGE
the away) - unix's "delete into a vacuum" method can be scary sometimes;

hmmm, I wonder how difficult that would be to implement as a TSR -
each time a file is saved, to keep the previous versions around in some
facet; probably would work best under a Minix partition - then you
could have filenames like work.doc;1, work.dos;2 etc...

What about GEM/4 which added in far better colour handling etc, plus
our modified version which allowed support for scalable fonts.

> And
> at that it wasn't really an improvement, more a patch to keep out of Apple's
> way on copyright disputes.
Wrong - that was GEM/2. GEM/3 was generally improved and made faster.
The font handling was changed, the ASSIGN.SYS file died and fonts
were compressed. Also in 3.1 support for bezier curves were added.

This was well before any of this made it to the Atari range.

Have you tried a different font (one other than the system font)? I've found the Gemini fonts to work reasonably well, as well as the Connect ANSI font (a smaller point size perhaps?). If you use the ANSI font (in size10, I think) and get rid of the scroll bar, then everything fits in on the screen.

I'd imagine on the TT and Falcon that it may be more "comfortable" on the screen (i.e. using a higher resolution and thus a bigger font size).

What version of Connect did you try, BTW?

>PLEASE can some one produce a decent comms program for the Atari, I am still
>waiting, or do I have to buy a PC clone..??

I dunno if you'll find a better one over there or not. I can't speak of the Windows world, but two of the better terms on the PC are Telix and Procomm (Plus) - and these are not GUI-based (exception: Procomm for Windows, which I've only seen)...

One of the things about Connect is that to get what you want, sometime you have to set it up ahead of time (i.e. the defaults may not be what you expect - line drawing in VTxxx mode, for instance). I dunno if maybe this is the case with gemszrz?

Robert Anisko

: Toswin 1.2 never worked for me. But TOSWIN 1.4 is great. Try that
: instead.

We all know that the new versions of MiNT are not distributable as binaries, but does this also apply to TOSWIN? I'm using MiNT .95 and would like to use the new TOSWIN if it will run with that old of a MiNT. Before you tell me to compile it myself, I don't have a large enough HD for GCC and for the little hacking I do HSC is fine. I just want the latest goodies.

Thanks, Randy

>actually use?

I think he *might* have been associating the background-downloading
with multitasking (i.e. exiting out of Connect, etc?). I haven't tried
gszrz, but with MiNT loaded, I had one window downloading some files
(I used NICE.TTP as the "protocol" calling zmodem, so I could use
my own priority settings) and was LHARCing some files in another
window.

Maybe the best way to put it is that the downloading will be
background, but you'll still be within Connect, but you can run
other things from within Connect as well (hmm - Connect is almost like
an alternative GUI if ya start doing that :-)

Come to think of it, you could probably even call another shell
from Coshy - like tc shell, and then Mupfel, and then...

>What I wish to do when dnloading is to get Directories of disks, type replies
>to e-mails, ie, simple things...
>
>Is this not posible..??

Assuming you get the GSZRZ figured out, it should be possible. If you have the space, try loading MiNT in, and running something like XYZ.TTP as the protocol (I'd advise using NICE.TTP as the protocol, and then XYZ.TTP as a parameter to that - gives ya some control over how much of the systems time resources are gonna be tied up). I'd think that an ACC would probably seem less intrusive on the time-slicing, however...

If ya get the downloading backgrounded, you should be able to maybe use Chameleon or some other means to access the file selector to mess with disk directory stuff (assuming you're using UIS III, LGS, or something of the like); or just use Connect's Coshy interface and do stuff from there...

As for replying to emails, do you mean on the system that you'd be presently downloading from, or on your ST itself? I've only seen one protocol that allows simultaneous downloading and typing to the remote system (Jterm or something like that).

I haven't tried this yet, but if you set up a window in Connect to be in VT52 or VT100 mode, you can then run a program (VI, perhaps?) that maybe will take advantage of the terminal emulation type via termcap? (just a thought).

>May be I need a PC Clone..??

If you can find a PC term program that does all you've mentioned, let me know. 'Twould be something to mess with on my 286... :-)

50% speed up, you must be joking.

Not all instructions are 32bit, not all pointers are 32bit.
You are not taking into account the cache or the fact that the COBEL chip
which is on a 32bit bus makes up for some of the speed lose (there are obviously
no wait states between the 68030 and the COMBEL).

Also there is the DSP and BLITTER which reduce the load off the processor.
In addition the SDMA sound system requires no processing time for the output
of sound.

Within this architecture there is no way you'd get anywhere near 50% speedup.

Why don't you use TMail-ANSI then? If you are not able to find a proper
font I really can give you no help.

>It did not save the conn0.set file the first time and the software is a bit
>unpredictable ..

Perhaps you met the Cancel-Button. Is this behaviour reproducible?
Only reproducible bugs we can talk of. Certainly the nearly 1000
registrated CoNnect-Users qould have told me about his bug, if
it existed.

And what do you mean by unpredictable? Be more specific!

>I am using GSZRZACC as a ACC version 3.4, how do I remove the Zmodem window,
>when I click on the close window button it crashed out of the dnload..

;) Closing the window will cancel transmission (RTFM!;-) Could you
think about any other possibility to get rid of a topped window
in GEM? Really not? What about selecting another window? Perhaps
CoNnects terminal window? In case you don't know how to do this:
Move the mouse to an area above CoNnects Terminal-Window and press
the left mouse button.

Wolfgang

This is no bug in CoNnect but in your version of NVDI. It is probably
2.01? In NVDI 2.01 you could not select a 8pt size system font.
An update to 2.12 will help you a lot.

Wolfgang

Sinclair --

Oh, c'mon and grow up, will ya? Did the original poster (Neuromancer) crosspost his request for advice to comp.sys.amiga or comp.sys.mac? If he had, your reply would have been quite appropriate. But it's obvious he wants to stick with an _Atari_ system so your reply was... well, a waste.

Neuromancer --

With hardware prices as they are, I would avoid upgrading any older ST as you can buy a complete new or used system for little more. Your upgraded 520 would still be a far cry from a Falcon. So if you want a Falcon, go ahead and get one! The only choice now is the Falcon configuration. Has anyone actually seen a 1/0 configuration yet? And remember that the Falcon internal hard drive must be a 2.5" IDE drive (not 3.5" SCSI), so keep that in mind when making your price comparisons. Also, you won't get AtariWorks and some of the other free software goodies with a 1/0 Falcon.

Hallo, ich poste folgendes f"ur einen Freund ohne e-mail-Zugang:

Hallo TeXdraw-User,

ich melde mich mit einer Frage und mit einem Angebot.
Zuerst die Frage:
- Da Jens Pirnay den Support von TeXdraw eingestellt hat, moechte
ich anfragen, ob sich schon jemand bereit erklaert hat, seine
Nachfolge anzutreten.

Nun das Angebot:
- Sollte sich noch niemand gefunden haben, wuerde ich mich gern
dazu bereit erklaeren TeXdraw weiter zu pflegen. Zwar habe
ich auch nicht gerade Zeit im Ueberfluss, aber es waere
schade, wenn ein so gutes Produkt wie TeXdraw einfach sterben
wuerde. Ich werde also mit Sicherheit nicht mit Versionen die
nur so vor neuen Features strotzen um mich schmeissen, aber
wenigstens versuchen,
a) die jetzige TeXdraw-Version zu debuggen (d.h. alle
Bugreports zu mir, und falls auch schon verbesserte Module
vorliegen, diese ebenfalls, damit ich dafuer sorgen kann,
dass jeweils die fehlerfreieste und am weitesten entwickelte
Version in Umlauf kommt)
b) die von Jens Pirnay angekuendigten Features zu beenden
(ich hoffe dabei auf seine Mithilfe und werde mich auch
bei ihm direkt melden, vielleicht kann er mir ja einige
seiner Unterlagen zukommen lassen, damit ich nicht nur auf
die Quelltexte angewiesen bin).

Ansonsten bin ich natuerlich fuer Anregungen jeder Art
dankbar und habe auch schon selbst einiges im Hinterkopf:
- kontextsensitive (das Wort musste ich einfach bringen)
Popupmenues mit den Bearbeitungsikons fuer kuerzere
Mauswege,
- Portierung auf den Falcon (scheitert momentan am
Megamax-Modula, aber vielleicht laesst sich da ja was
machen)

Ich warte gespannt auf Eure Antworten. Bis dann
Jochen.

P.S. Ich habe momentan noch keine eigene E-Mail-Adresse (kommt
noch), bin aber ueber Martin Schroeder zu erreichen.
Wen die Post noch nicht so veraergert hat, dass er eventuell noch
Briefe schreibt, meine Adresse:

Source record: 206819

It wasn't very long ago(this past week), that I had GCC up and running (Thanks to Warwick Allison). I tried adding the files to get G++ up and running and this seems to be my problem.

When compiling a C++ program, I get a HUGE list of errors. These are not from the program itself but from the header files. Now, when I try to compile a regular C program, I get the message "unterminated character constant." I don't know if this has to do with the errors for the C++ program.

I pulled all my files from the "mirrors" directory at wuarchive.wustl. I thought I saw a couple of messages saying that there were problems with the files from this site. Was I hallucinating?

I also recall that someone finally got the thing working after FTPing the files from some site in Europe. If anyone happens to know what the site is, could you e-mail it to me?

I'd be greatful for any suggestions that anyone might have also.

Thanks alot.

sr> far to small and the program seems a little bugy, it did not save the
sr> conn0.set file
sr> the first time I tried, the Text in that mono mode is far to
sr> small..

Well, I can only suggest you play around with it a bit more. I myself am
useing it in TT Medium and find it a great program. In combination with
FSER094 I can use my ZyXEL on Serial2 flawlessly and there are a lot (I
mean a lot) of options in CoNnect. In the beginning you have to get used to
it a bit, but after that you'll love it.

sr> Also no background dnload with gzrzacc at all, I was informed that if
sr> I had gzrzacc version 3.xx it would dnload in the background, NO IT
sr> DID NOT..!!

Of course it will not! Not unless you're running MultiTos that is. Under
MultiTos, background d/l is possible with only a small amount of CPS loss.

BB>
BB> So Atari has finally admitted they had no interest in the TT...

Not quite. Users had no interest in the TT. TT's didn't sell anymore. Furthermore, Atari redefined their stategy. They are now focussing on the consumer market, not on the low-end DTP market, which upsets a lot of people in Germany, since quite some people are useing their TT's just for that. Also with DMC porting Calamus SL to the Windows NT platform, lots of users are afraid that one of the programs worth buying an Atari for will be discontinued.

There is 16MHz from the shifter chip. (pin 39)

Obviously you must buffer it and you may also want to get the drive to switch between 8 and 16 automagically. i am doing the same thing, so let me know how you get on.

> think it could handle.

It won't handle it.

The atari color monitor runs at tv standards - 525lines/60Hz or
625lines/50Hz, which translates to a horizontal line frequency of
15.75 or 15.625kHz (Lines*refresh speed, but they're interlaced -
only half the total number of lines in each screen refresh).

Almost all VGA cards output a horizontal frequency around 30kHz
or higher. The mono monitors can display VGA because this is the
approximate spped they run at. The color monitors can't handle
these high frequencies.

Another thing to bear in mind is that the dot pitch (spacing of each
triad of display dots) on the atari color monitor is only .4mm. VGA
monitors these days sit around .28mm - the image from the atari
monitor isn't as clear as a VGA.

Sorry, you'll have to buy a VGA monitor, or a Multisync if you want
to use if on your atari too.

The reason for converting atari mono monitors to VGA is that they're
extremely good low radiation paper-white monitors with long
persistance phospher, and as such are brilliant for DTP or word
processing applications.

>soon be this country's ONLY glossy covered Atari rag if AE goes to a
>newsprint format. <sigh>

There are a few problems with Current Notes, and I and another author/editor on GEnie tried to help last year, but our efforts were unwanted. These problems include misinformation by the columnists, half-baked "reviews," and blatant typoes, misspellings, and grammatical errors.

The only redeeming value of the magazine is Dave Troy's articles, but I don't want to pay for a single article each month; I want a whole magazine, and that's not what I was getting.

I don't have a subscription to a single ST magazine anymore. I get much better info from GEnie. I do get AtariUser at my user group meetings, and Atari Explorer comes every so often, but that's it. And if you ask about that other ST magazine that's based in Oregon, well, I got a whole 'nuther set of comments for that one. :^)

I wish I had more positive comments about this topic, but I don't.

Yup, try atari.archive.umich.edu, I even posted a message to this group
last week stating that i'd just sent another one there.

The best one there to get is Captains QWK. (CQWKE2?.??? rouhly!)

I've also got the IMHO one that everyone on the FIDO atari echo's
raves about, but I don't think it's that great, I found Captains better.

> this, please direct me to it.
>
That's very simple. Just buy 16 RAM-Chips 411024-120 (1Mbit-120ns) and put
them in these empty slots. Then get 16 condensators of 330nF and put them
near the RAM-chips. The places are marked. Finally check if CASL1, CASH1
and RAS1 are connected over resistor of 33 ohms to the RAM-chips.
MMU: CASL1 Pin 21, CASH1 Pin 22, RAS1 Pin 18
RAM: CAS Pin 16, RAS Pin 3
CASL1 is going to 8 RAM-chips, CASH1 is going to the other 8 RAM-chips.

have fun with 4 MB.

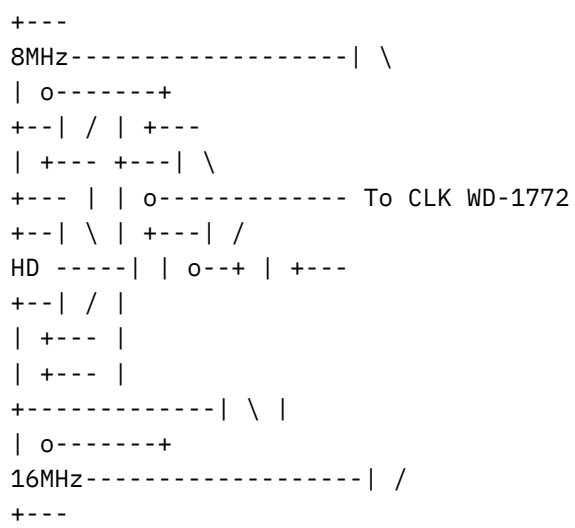
> 16 automagically. i am doing the same thing, so let me know how- you get on.

You can do it with one NAND chip (74HC00). Connect the gates as following...



When the HD signal is LOW 8MHz clock is transmitted. When HD goes HIGH (for HD operation) 16MHz is feeded to the controller.

If your drive has an inverted HD signal, exchange 8 and 16 MHz.

If you plan to use a second drive, then you have to check that clock switching happens only when you access an HD disk. This may be solved adding some gates to control the switching depending also on which drive you are accessing.

You can also use following signals:(for example)

DS0 (Drive select 0 normally A)
DS1 (Drive select 1 normally B)
HD0
HD1
MON (motor on, if you want to feed 16MHz only when accessing a HD, avoid the WD 1772 to overheat)

Eventually you can also make an automatic step-rate adjust (but this is well done (i believe so) by the Ajax floppycontroller)

Hope this helps...

: something called IMHO, that is supposed to run only on 1MB machines.
: I'd be interested in hearing wherefrom to get these two, or maybe
: something else that is good.

Finding a good QWK reader is rather difficult on the Atari. Our local user group has been trying to find a decent one for a while. At the moment IMHO 1.03 and CQWK 2.2 seems to be the favourites depending on who you talk to. IMHO was written by a guy called Ian Print in the U.K. so I think that it should be available somewhere nearer you than us. If you can't find it on one of the european archives that carry Atari stuff I'm sure that Me or someone else could send it to atari.archive.umich.edu.
Maximiser is a little older and it works but is not as good as either CQWK or IMHO.

DCL on Atari would be a _very neat thing_ to have.

POSIX, i guess, needs a memory indirection which the Atari cannot do
(therefore, swapfiles are not possible in the way Unix or VMS do).

How about installing GDOS or NVDI and using another font? (What version of ConNect was it?) Also you must see, that 99.99% of the STs used in germany run in Mono mode, and that it's not much use for a program supporting the lower resolutions.

> Also no background dnload with gzrzacc at all, I was informed that if I

After a week on vacation, I cabn't take the time to scan through 400 new posts,
I assume that there are still no Falcons being sold in the US?

>> by Atari due to lack of interest. Seriously. Well I guess if you
> I'd be curious to know just how many of those things they even
> sold. I wonder if it is more than the ill-fated ABAQ?

It seems to me that Atari doesn't know very much about the market they were
in...

The TT is/was the only _professional_ machine Atari had.

Maybe Atari can sell the Falcon in the US, but they will loose (or, have
already lost, seems more correct to me) the european market.

The company I was working for last year sold nearly as many TT's as 1040ST's
(what was sold more, was the Mega STe, and that one was
discontinued, too :-(...). Atari is really great at shooting itself...

Date: 1993-04-27 10:38:45 UTC
From: am@Materna.DE
Message-ID: <am.735907125@materna>
Source record: 206832

Hello !
I want to dump EMACS 18.58 under MiNT 0.95 and BASH-Shell on my Mega-ST with
4 MB RAM. But I will get the following messages when I start the program
dumpemac.tos in /e-bin .
FIRST DUMP Commandline: ./temacs -batch -l loadup.el dump
CANNOT OPEN LOAD FILE: loadup.el
COULD NOT RENAME FIRST DUMP TO XEMACS.1 !!

MY ENVIROMENT - Variables for EMACS may be correct :
EMACSLOADPATH=/dev/D/emacs/e-bin
EMACSLIB=/dev/D/emacs/e-lisp
EMACSDOC=/dev/D/emacs/e-etc

What is my problem ? If you can help me, please mail me !

Thank you, even yet !

>a developer who *has* a 120mb Quantum drive in his falcon.

Of course it is perfectly possible to have a 2.5" IDE drive in the
falcon, but I think it might perhaps not be possible to have both the
ZIP ram and 2.5" hard disk in the Falcon. I heard that room is very
tight in the Falcon and that might make it necessary to use an external
drive with the ZIP ram board installed. But of course I could be wrong
so if someone has a Falcon, please check if it might still be possible
to fit both.

I do not use GCC even though I have the resources, so I only have used
the 0.95 binary. And with that the TOSWIN1.4 program. It works fine in
this combination. Toswin 1.4 should be available on the major archives
in both source and binary form.

6114. GDB 3.6 for Atari/MiNT (Update)

Newsgroup: comp.sys.atari.st
Date: 1993-04-27 12:07:08 UTC
From: schwab@issan.informatik.uni-dortmund.de
Message-ID: <SCHWAB.93Apr27120708@issan.informatik.uni-dortmund.de>
Source record: 206830

I have just uploaded an update to my port of gdb 3.6 for Atari/MiNT to ftp.germany.eu.net (192.76.144.75). It will soon be available in pub/comp/atari-st/mint/gdb36p2s.zoo. I have also prepared a binary, available in pub/comp/atari-st/mint/gdb36p2b.zoo. The first version didn't include the sources for readline (mea culpa), and a small patch was needed.

For all who didn't see the first announcement, this is a full featured port of GDB 3.6, which works with MiNT 0.98 or later. Only core files and remote debugging are not supported. It also includes an improved support for C++ and GCC 2.x.

The original sources are still available in labrea.stanford.edu:pub/gnu/gdb.xtar.Z (i hope :-)

Enjoy,

Source record: 206834

hi!

Someone in this group mentioned the existence of GNU fax once. Is this
a project or does the program already exist? Is there an Atari version?
where can you get it (if possible _NOT_ via ftp, I have no FTP)? Can
somebody put it on atari.archive.umich.edu (we have a mirror of that
one at our university...)?

thanks in advance...

martin

P.S.: there's been a lot of talk about bugs in CoNnect lately. Well, I am
a registered user and can only say that it is a _GREAT_ program. Go ahead,
register it too. (it makes work with the program much easier, after all the
free version _IS_ only a demo). The only bug I found in v1.96 (the most
recent one?) is a graphic bug in the "Gebuehrenzaehler" (tax counter).
This one is known to Wolfgang, the author of CoNnect, and he promised to
correct it. Anyway, CoNnect is the best shareware program I know for the
Atari..

It is important to know, that LaTeX is only a Macropackage for TeX, so running
LaTeX without TeX is impossible.

I recommend cs-TeX 4.0, which is available on several ftps, since it is a complete
system with dvi-drivers for almost every printer and a window-based dvi-viewer.
It also includes Metafont, which is necessary to create the fonts needed for each
output device (here: the screen and the BJ10ex).

cs-TeX 4.0 needs 8 Disks and can only be installed on an HD (a fact some people
don't realize when they want to run TeX). I don't know if it runs with 1 Meg only,
but i recommend to have 2.5 or more Megs, since TeX needs much memory sometimes.

For the beginning, cs-TeX 4.0 offers all you need to work with TeX. (At most
ftps, cs-TeX 4.0 has it's own directory.)

Hope I could help a bit

Blush, Blush. I am using TOSWIN1.4! Didn't know what version I had so
when I saw 1.4 mentioned I figured it was a newer version. Is 1.4
indeed the latest and greatest? Or is this all a moot point and I should
just run out and buy MULTITOS? And one more thing related to the slowness
of text writing in TOSWIN. Where can I get NVDI here in America and how
much is it?

1000 pardons,

OK from the mail I've been getting, GER2EN21 works fine with TOS 4.04
but it won't work with TOS 4.01 (The machine I tested had TOS 4.01 :))
So there you have it, to run the program you need TOS 4.04 on the F030

That's just exactly the problem. Although there is no excuse for rudeness, the Atari "revolving door" has been so busy of late that there is only a handful (literally!) of people left to do the job required of a hundred. Long time developer support person, Gail Bacani, just recently left the company. Atari Explorer magazine is being reorganized (again!). John Townsend (aka the "TOS God") has left. And they are having a fire sale of ridiculous "odds and ends" of parts left over in Atari warehouses (send GEmail to G.LABREC on GEnie for info). If this does not sound like a desperately cash poor organization, I don't know what does!

It may not be over just yet, but a fat lady is warming up in the wings.

Yes, CS-TeX does run in 1 MB RAM. The problem with TeX in general is that the amount of RAM the program will use is hardcoded in the binary. So, if you want to use more RAM, you need a version that has more RAM compiled in. This version is usually called "bigtex" or something similar.

I forgot exactly what versions of CS-TeX are included in the 4.0 distribution, but if I remember correctly there are versions for 1, 2.5 and 4 MB.

6125. Atari Purchase, WOW!

Newsgroup: comp.sys.atari.st
Date: 1993-04-27 16:19:52 UTC
From: neurom@u.washington.edu
Message-ID: <1rjmf8INNg5o@shelley.u.washington.edu>
Source record: 206844

Well, that was interesting. Four days with no response and then oodles within two. I want to thank everyone who helped my with my decision, and I want to give a special thanks to Mr. Peterson for reminding me why I don't want a Mac or Amiga. Namely, you don't barge into other people homes and start insulting their family. Thanks, Brian. ;)

Anyway, for all concerned, I'm going with option two. Reasons:
1. Atari Works, SpeedoGDOS, and Falcon2D2. I just got confirmation that they don't come with the 1/0. Biggest reason.
2. More Hard Drive space.
3. SCSI-II vs. IDE. Hmmm, tough choise..... ;)
4. I can't afford 14 megs in the near future anyway, so why plan. Besides, if things go poorly (knock on wood), I can get the propriatary RAM really cheap, while Zips is Zips is Zips. That and the fact that I saw some SIMMS made by sticking nine ZIPS on a board. Must not be too much demand.

As a side note, like I said I am a dealer. I know that 2.5" drive limitation, I've put drives in a dozen A1200's, so I'm very familiar w/ Maxtors "Deck 'o Cards" drives. [Please, no trator posts, it wasn't my decision, I don't own the place.] And as far as the ZIP ram goes, there's an expansion board out that holds either 4 or 14 megs in 1 or 4mb ZIPS. It does fit w/ the HD in there, it replaces the existing RAM board, and I believe the ZIPS fit on their sides.

Thanks again!

Quote of the Day:
"My dear Watson, if you eliminate the impossible, whatever's left, however improbable, must be the truth."
"What if there's nothing left?"
"Then you're screwed."

I know that the Falcon IS F030 compatable. And it does run in the TT modes
as well, which includes 640x480x256. There is an update coming this summer
that takes more advantage of the Falcon's abilities as well as fixes several
bugs. ALso look for some maor updates in the modules.

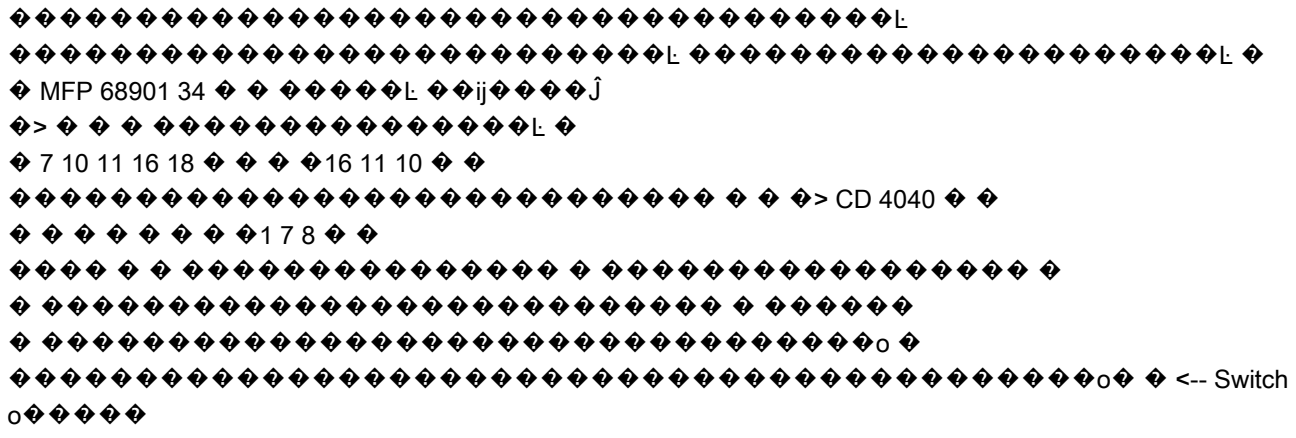
Source record: 206513

Hello swhatley@blkbox.COM,

s> Is there a way to allow my ST to run at 38400 buad? Any help will be
s> appreciated.
Here is a cheap version to get 38400bps on the 8 mhz Atari, I try to translate
the important parts:



IMPORTANT:
Pin 16 (MFP) cut and bend up !!

Connection list:

1.) Pin 7 (MFP) together with Pin 10 (MFP) switch - MID
2.) Pin 11 (MFP) nach Pin 16 (CD 4040)
3.) Pin 16 (MFP) (bend up !) switch - RIGHT/UP
4.) Pin 18 (MFP) nach Pin 10 (CD 4040)
5.) Pin 34 (MFP) nach Pin 11 und 8 (CD 4040)
6.) switch - LEFT/DOWN nach Pin 7 (CD 4040)

I run this now for some month and it is great. I don't have a switch, I always
run 38400bps with my Zyxel modem.
Price should be unter 1$

Source record: 206847

My 68000 version of MINT 1.04 is not capable to cope with more than
one accessory. I compiled it several times (and let someone else do
it for me once, cos I could've forgotten something) with different
GCC-Versions (-DMULTITOS erased, renamed to mintnp, ...),
but each time with the same result.

- after the first accessory is installed exception #11 is raised (should
be linef), and mint exits.

- If only one accessory is there everything works fine.

tested with:
toswin 1.4
xcontrol 1.2
mouse (very small acc)
desktop1 (displays pictures on desktop)

A guess: (Maybe some MMU-Instructions found their way to the 68000 version)

Ciao
Rudolf.

> Lets face it, all these features take space.

Memory protection (yes). How many other microcomputer OS's provide that?
Palette management - already addressed in someone else's posting.
New filesystem - already addressed. You've obviously never spent any time
looking at the loadable filesystem and device driver support in the kernel.
Split Loading - do you mean demand paging? That tends to be a feature of
a virtual memory system, which you've already written off. MultiTOS *does*
support shared-text executables though, where subsequent loads of a program
that is already in memory will only load the data segment off the disk,
reusing the text segment in memory.

Calamus SL does run on the Falcon! As far as I understand, the res it was running in at DMC when I saw it was 640 X 480 X 256 colours. Even better was SL running on Mario's TT w/ a MAG colour monitor running 1024 X 768 X 256 colours with Cybercube's Cyrel Sunrise VME colour card!

Pro24 is protected with a cartridge dongle. If your friend still
has the dongle he could contact Harman UK M0753 576911 and ask
for disks.

Kinda yes and kinda no. Run PC, the Atari dealer in Ft. Collins, CO.
just got its demo unit in last week. It came fully equiped with
MultiTOS, SpeedoGDOS, Atari Works, and the Audio Fun Machine. They are
expecting to get a shipment of saleable ones in another couple weeks.

The best GIF site I've found is at the Finnish State Computing Centre (nic)
in Finland, There is FTP but I've only used the mail server, the address of
which is:

mailserver@nic.funet.fi

mail it the text 'HELP' for instructions on how to use it.

There are some really nice GIF's in /pub/pics/gif/pics/sports/skydiving (my
sport) and /pub/pics/jpeg/views/eclipse (solar eclipses). There is so many
pics in the gif and jpeg directories you'll be spoilt for choice !

6136. FOR SALE: Misc. ST and HD stuff

Newsgroup: comp.sys.atari.st
Date: 1993-04-27 22:40:35 UTC
From: u1427@cs.uiuc.edu
Message-ID: <C65yzn.ExA@cs.uiuc.edu>
Source record: 206740

FOR SALE:

** General HD equipment **

Miniscribe 40/60MB Hard drive (40 Meg MFM / 60 Meg RLL):
(I don't have the model number with me because I'm at work,
but I can get it at home later.)

*** $70 ***

Adaptec 4070 SCSI to RLL HD controller/converter:
(or is it RLL to SCSI?)
This allows you to hook two RLL hard drives up to a
SCSI controller.

*** $50 ***

** Atari ST Equipment **

Atari SC1224 Color Monitor: *** $75 ***

Atari SM124 Monochrome Monitor: *** $50 ***

ICD SCSI Host Adapter w/clock: *** $30 ***
(This is not the LINK cable or the newer
Host adapter, but it works fine and
should work with the current software.)

Navarone 8-bit audit digitizer: *** $25 ***
(This plugs into the cartridge
port and allows you to record and
play back sounds on your ST)

Reason for selling: My 1040ST that I used all of this with died.

Eric Brown
University of Illinois
u1427@sparc0b.cs.uiuc.edu

home phone: 359-0010
work phone: 244-8298 (after 4) - (yes, really after 4)

** Even if you call me, please send e-mail. I will give preference
** to the order that e-mail gets to me.

I would prefer to sell this locally, as I don't have the boxes for
the monitors with me at school. (BUT, I will consider anything)

Steps for the future SECOND drive:
- hook it to your computer and remove any auto-boot driver by using HINSTALL -
remove top cover: 9 screws (rectangular holes).
- through one of the bigger holes in the metal shielding, you see 3 DIP
switches. Flip the middle one.
- Reassemble.

Steps for the future FIRST drive:
(None)

Good luck - Peter

I desperately need a color emulator. If anyone has one (uncompressed)

I will trade software or pay $$ for a copy of Omnires, or I can

call long distance and get it directly.

Thanks

Allen

6146. UPLOAD: GEM++ v1.5 - Free GNU C++ GEM class library

Newsgroup: comp.sys.atari.st
Date: 1993-04-28 02:04:48 UTC
From: warwick@cs.uq.oz.au
Message-ID: <13143@uqcspe.cs.uq.oz.au>
Source record: 206715
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

```
Available from atari.archive.umich.edu...
(in the /atari/Programming directory)

GEM++ is a class library for C++ that adds a layer of abstraction to
the GEM/AES/VDI system functions.

Included are all sources, makefiles, and an EXAMPLE program - ready compiled,
so you don't even need a compiler to see what it is all about. The example
program simply exercises a few of the features of the library.

A large range of classes are available, representing most of the GEM concepts:

FILE CLASS : BASE DESCRIPTION
-------- -------------------- ---------------------------------------
gemap GEMapplication - One for every program.
gemda GEMdeskaccessory
: GEMapplication - One for every desk accessory.

gemr GEMrsc - Loads and frees RSC files.
gema GEMactivity - A user interaction - the main loop.
geme GEMevent - A GEMactivity generates these.
gemfb GEMfeedback - The result of GEMevent processing.
gemks GEMkeysink - Key event consumer in a GEMactivity.
gemt GEMtimer - Timer event consumer in a GEMactivity.

gemw GEMwindow - Standard GEM windows.
gemf GEMform - Standard GEM forms / dialog boxes.
gemm GEMmenu
: GEMform - Standard GEM menus are forms.
gemhf GEMhotform
: GEMform - A GEMform that with extra features.
gemfw GEMformwindow
: GEMwindow, GEMform - A GEMform in a GEMwindow.
gemfiw GEMformiconwindow
: GEMformwindow - Iconifiable GEMformwindow.
gemd GEMdesktop
: GEMformwindow - Standard GEM desktops are forms.

img IMG - Standard GEM image format.

vdi VDI - Standard GEM vdi calls.

gemrawo GEMrawobject - GEMforms are made up of these.
gemo GEMobject - Extensible layer on GEMrawobject.
gemsl GEMslider
: GEMobject - A slider extension.
```

gemto GEMtextobject
: GEMobject - A text extension.
gemimgo GEMimageobject
: GEMobject, IMG - An extension that displays an IMG.
gemuo GEMuserobject
: GEMobject - Extension with user defined graphics.
gemvo GEMvdiobject
: GEMuserobject - User graphics drawn using a VDI.

gemal GEMalert - Standard GEM alert boxes.
gemfs GEMfileselector - Standard GEM file selector.

gemsb GEMstreambuf
: streambuf - Interprocess communication.
gemrec GEMrecorder - Records GEM events.

GEM++ has been developed with the GNU C++ compiler (G++), and so I can't garauntee it will work on other compilers (but hey, if you manufacture a C++ compiler for the Atari ST/TT, give me a free copy and I'll gladly port GEM++ to use it!).

GEM++ is Free software, protected by the GNU Library General Public License, which basically means you can use it for free, and even SELL it, or sell any programs you write using it. You just have to distribute (or make available) the ***GEM***** sources (not your own code) with the product. And you can't get much fairer than that!

(MOST OF) THE NEW THINGS IN GEM 1.5 SINCE GEM++ 1.2:

- Detailed manual entries for every class.
- Added user-loaded RSC files (as opposed to GEM loaded single RSC file)
- Scroll bars now fully automated - even with GEMformwindow.
- Added new class: GEMformiconwindow - iconifiable windows!
- Vastly extended GEMslider interface - matches window slider conventions.
- Moved GEMmenu::DoItem(...) up to GEMform::DoItem() - allow the simple interface of GEMmenu to be used on all GEMforms.
- Updated VDI to latest standard (thanks Bammi!)
- Added extension methods to GEMhotform.
- Added example desk accessory.
- Added new examples to example.cc.
- Improved overall consistency of filenames and classnames.
- Added etc/default.mak to avoid set-up problems.
- Top-level include file is now "gem++.h", not "gem.h".
- Added split main-loop to GEMactivity.
- Added direct-text and PRINTF-style GEMalerts
- Improved completeness of GEMevent
- Added GEMform::Map() - object traversal
- Moved GEMrealobject to own file, and renamed to GEMrawobject.
- Heaps of bug fixes, including bringing GNU C++ 2.3.3 compatibility.

Sorry I don't distribute GEM++ in patches yet. It has been quite dynamic in the past - but is settling down a lot now, especially since I used it

to write my GEM port of NetHack.

Any help you need in setting up GEM++ or GNU C++, I'm right here on the net.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've been trying to get at the GNU C and MiNT files from atari.archive for a long time now. I've sent out Email questions, and have sent all the proper mail with the "help" message as the FAQ said to do. However, I have been unable to achieve success.

Please help me by sending instructions on how to recieve files from atari.archive through Email and how to get some sort of file index. It would be greatly appreciated.

If you recieve duplicate postings of this message, send duplicate replies! Maybe I won't get them all! I'm going to try sending a copy of this to a bunch of places, so you may see it more than once.

Send all Mail to evanlang@sdf.lonestar.org

Thank You for any help you can send,
Evan Langlois

6148. atari.archive.umich.edu bi-annual faq

Newsgroup: comp.sys.atari.st
Date: 1993-04-28 02:22:48 UTC
From: weiner@terminator.rs.itd.umich.edu
Message-ID: <1rkppo$m57@terminator.rs.itd.umich.edu>
Source record: 206716
Cross-posted to:
comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy,umich.archives,umich.post.myke.post,alt.felching.gerbils

The atari.archive.umich.edu "Just the 'faqs' faq" - an Umich Atari Posse Product

This faq has been revamped to provide just the "faqs", less talk
and more rock. Ready?

1. How the hell do I get to atari.archive?

By order of preference:
1. AFS (if you don't know what it is, you don't have it, forget I
mentioned it).

2. Gopher (Other gophers/North America/USA/Michigan/Merit/Software
Archives).

3. FTP - Be sure to check for mirrors that are closer to home. For
instance src.doc.ic.ac.uk (/computing/systems/atari/umich) and
wuarchive.wustl.edu (/mirrors/archive.umich.edu/atari).

4. Mail - Send mail to atari@atari.archive.umich.edu with a body
of help for the help file. Questions about BART to
brode@atari.archive.umich.edu

2. Uploads?

You bet we want 'em. Via afs, cp into /afs/umich.edu/group/itd/archive
/atari/New. Via ftp, ftp into atari/New (will not work at mirrors).
Via gopher, impossible, see mail. By mail, uuencoded chunks to
weiner@atari.archive.umich.edu.

3. Sacrifices in our honour?

You bet. Small children and farm animals only please.

4. Why the hell do things take so long to get from New to the
archive?

Lack of spare time. Lack of sacrifices. We're working on it. Really.

5. I'm completely confused by this post, who can clarify it for me?

I'll do my best, weiner@atari.archive.umich.edu. If that don't work,
weiner@terminator.rs.itd.umich.edu. If that don't work,
weiner@stat.umn.edu. If that don't work, weiner@beryl.labmed.umn.edu.
If that don't work, Jeff Weiner 414 Erie St SE #14, Mnpls, MN 55414.

Good night,
--

Jeff Weiner - weiner@terminator.rs.itd.umich.edu - Umich Atari Posse -

>wanted one they'll probably be real cheap soon.

This is NEWs?

I've known that for AGES. And I still bought my TT. The TT is the current Atari HIGH END machine. It's the best thing for people who need speed from the machine. When the Falcon040 is released, the TT will have no purpose.

[aside..]

... then my girlfriend can have the TT and her ST (my old one) can filter down to my young sister. (No computer these days is worth selling - unless you've only had it for 12 months, in which case, you just threw money away when you bought it).

Just grab the sources to "find". I've got it compiled at home right now.
(I use it under MiNT, but it probably works under TOS too).

6152. SC1224 as tv monitor?

Newsgroup: comp.sys.atari.st
Date: 1993-04-28 04:04:34 UTC
From: gt7610c@prism.gatech.EDU
Message-ID: <95069@hydra.gatech.EDU>
Source record: 206720

Since there is discussion on the SC1224, I was wondering if it is possible to use the monitor as a tv monitor via a tuner source such as a vcr or cable box. If so, how. If not, why not? Since it is similar to a CGA monitor, why couldn't it work?

TIA,
John

Source record: 206725
Cross-posted to: comp.sys.atari.st,misc.forsale,rec.music.synth

I'm graduating and have to move this equipment out. It has served me
extremely well and will be missed. [sniff, sniff..] So here we go!

This is the perfect musician's machine, all you need to
do is pick the right MIDI software that fits your needs. Then
when you aren't using the MIDI you can do word processing, desktop
publishing, log-in to bbs', print out whatever you need, etc.

The prices work as follows: if I were to consider selling the items
individually, the prices I would be asking are listed w/ each piece. BUT,
I'm graduating in 2 weeks and would like to sell everything as a package; so
at the end of this message is what I'd like to get for the entire haul.
Depending upon the responses I get, I may be negotiable (try me :).

Package includes: all hardware, over 300 disks of software

*** Mega ST2 $600 (includes all upgrades listed)
- nice design, comfortable external keyboard, has room on the
motherboard to easily be upgraded to 4 meg

- MIDI ports

- TWEETY board installed (splits the ST's sound output into 2
channels to be played through your stereo)

- SWITCHABLE TOS 1.2/2.06 (the newest TOS, I installed the switch
myself; it allows you to have complete compatability with any
software by choosing the operating system it's most compatible
with. 2.06 is extremely fast and has TONS of features - nicer to
use than macs or windows IMHO)

- all the usual ports- parallel, serial, hard drive, 2nd floppy,
monitor, etc.

- golden image mouse

- extra atari mouse

- Warp 9 registered & installed

**20 meg hard drive $200

**SC1224 Color Monitor $200
- will accept either 60 or 50 Megahertz sinc

**SM124 Mono Monitor $125
- internally adjusted for maximum screen size

**2400 baud modem & software $50

**external DS/DD floppy $50

**Epson LQ-850 high speed 24 pin printer $200

**Navarone Video Digitizer $40

**Monitor Master $40

**Mouse Master $30

**2 Wico joy sticks $20

**software: $600
|
- I have almost EVERYTHING you could ever need/want - word processing, telecomm, programming, graphics, music, games.

I have *** 335 *** disks of software. Plus an additional 40 or so blanks.

All appropriate cables, power supplies, and manuals are included. All of the equipment is in extremely good condition. Everything is clean and has been VERY well kept.

- I also have some of the boxes for the hardware (computer & 1 monitor I think.

****
Total cost = $2,155
****
******
I will sell it all for $1,300
******

plus 1/2 shipping (or will deliver within 1 hour driving time of Buffalo, NY)

If you are interested in what I've got, E-mail me at this account. I log in daily..

.Philip

[> and this will excuse your strong statement. There are lots of people
[> working in mono mode in CoNnect having 24x80 character size windows
[> with appropriate font sizes.

Actually, it does not excuse his statement at all. I have never read
the manual (as you said, it is written in German) and I never had a
problem with the fonts. After all, how hard is it? Choose a font,
install it, select. Different font sizes give you different size
windows (which is obvious). I personally do not need to see every
column on the screen, so I use the Rufus 12 Point font. Excellent
looking ANSI, in a nice big font.

CoNnect is a great program. If he has problems using it, blaming you
(or the world at large) will not help him. At the very least he could
have sent you an E-Mail explaining the problem instead of ranting at
the whole world that it is worthless. An old saying comes to mind; can
he do better?

>It's unlikely you'll find any advantage to "word bitplane" addressing
>over regular "single bit" bitplanes. Let's leave the generalizations
>behind and try the "real world" test. If you can show me an
>example...

Simple. Scrolling.

By using the movem instruction, you can easily load 48 bytes at a time into registers, then write 48 bytes back out. With word-interleaved bitplanes, in a 16 colour (4 bitplane) mode such as ST-Low, you can therefore move 96 pixels (96 pixels = 24 CONSECUTIVE words). With a bitplane-interleaved system, you must move 6 words of the first bitplane, then 6 words of the next, then 6 words of the third bitplane, then 6 words of the final bitplane.

See. Examples are easy. That's why I said there are Pros and Cons for each. But no, you just *had* to insist that one was absolutely better or absolutely worse than another. Oh well.

>In my terms that would be the "crippled word-interleave modes
>right up to 8 interleaved bitplanes and a crippled 16-bit (word-per-pixel)
>mode (because it doesn't have colour registers)."

How many video output systems have 128K of colour lookup table?????????????

Do you think 24-bit video is equally crippled? They NEVER have CLUTs.

6159. WP to ST

Newsgroup: comp.sys.atari.st
Date: 1993-04-28 09:08:52 UTC
From: optimus@tigern
Message-ID: <1993Apr28.090852.13949@dhhalden.no>
Source record: 206730

I wondering if someone could help me with a little problem I got.
My girlfriend uses a PC to write reports at school, but would like to
sit at home to work on them in the evening. The problem is that she
is using Word Perfect for her reports and I cant load them into any of
the wordprocessing programs I got at home.

My question is this: Does there exist a program on the ST which reads
and writes Word Perfect files(v5.1 I think)? Or a program which can
convert WP files to a common ST format?

I really hope that it does, because she is threathening me to buy a PC(cant
understand why, really) :)

6160. ** PRESS RELEASE: MasterBrowse 2.0

Newsgroup: comp.sys.atari.st
Date: 1993-04-28 09:29:34 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.qFsdcQFNkHI@elfhaven.ersys.edmonton.ab.ca>
Source record: 206776

MasterBrowse 2.0: PRESS RELEASE

Press release? Sounds a little formal for a free program, huh?
Still, what can you do?

After a month of bug fixes, new features, documentation writing, and
beta-testing the second release of MasterBrowse is ready. So much has
changed that the program is nearly unrecognizable! Here is an excerpt
from the documentation which should give you an idea of why MasterBrowse
is the best text file viewer available!

MasterBrowse has been sent to comp.binaries.atari.st and the
atari.archive mail/FTP (mbrowse.zoo or MBROWSE.ZOO) site.

MasterBrowse is a replacement text file viewer for any Atari
computer, in any resolution with a size greater than or equal to
640 X 200. It offers many features that the Atari text file viewer
does not:

o MasterBrowse has a very fast GEM user interface, with special
features such as flying dialogs raster-copy redraws, and pop-up
menus. Of course, all functions in MasterBrowse can be accessed
through the keyboard as well as the mouse.

o MasterBrowse has -extensive- documentation.

o MasterBrowse allows you to have a virtually unlimited number of
documents open at the same time, restricted only by the number
of free window handles and the amount of memory available.

o MasterBrowse can use the command line (of course) to open
documents (or open a document batch). The ARGV, xArg, and standard
command line formats are supported.

o MasterBrowse allows you to use all of your familiar movement keys.
You can use the arrow keys, the application keypad, or the space
bar and the return key.

o MasterBrowse allows you to move in any direction inside a
document, as you would expect. What you might not expect is that
you can tell MasterBrowse how far it should move when the movement
keys are pressed. How about moving two lines down instead of one?
or perhaps three lines suits you better?

Do you still want more? Keep reading.

-You can jump to a specific line, a specific page, or any
of ten personal "bookmarks" that MasterBrowse supplies (for

each window).

o MasterBrowse also offers you the ability to search for up to three strings (at the same time) inside a document (case sensitive or case insensitive), starting at the top of the document or the current position. If a search is performed starting at the current position within the document, MasterBrowse can be told to search in forward mode or reverse mode. After the string is found, another command may be used to find the next (or previous) occurrence of the string.

o MasterBrowse also has block functions. You can mark a block off, and then save it to disk, print it, or write it to the clipboard. You (!) can decide how the block is marked on the screen. MasterBrowse can also be told to remove the block markers after a block operation is completed. Unlike previous versions of MasterBrowse, blocks can now be marked using the *MOUSE*.

o MasterBrowse is a master printer. It can print a document (or a block) with page headings, page numbers, line numbers, a description of the file or block, or a combination of the four. It can even print an identification string for those people who share a printer between more than one computer.

o MasterBrowse gives you complete control over your windows. You can cycle through them, change their titles, shrink them, close one, close them all, or get information about them all from the keyboard (or the mouse).

o MasterBrowse saves the positions of the first seven windows, so you have complete control over where your documents appear and how your screen looks.

o MasterBrowse allows you to load and save different configuration files.

o MasterBrowse displays (optional) progress maps, just like the Desktop.

o Every window has a set of block markers and and a set of ten bookmarks to itself.

o MasterBrowse supports batch files! If you use a certain group of documents often, just load them up and tell MasterBrowse to create a batch file. One double-click on the batch file, and they will all be loaded again.

o MasterBrowse also has support for the clipboard! A block can be written to the clipboard (with or without text formatting) or the clipboard can be read into memory and treated like a document.

The features listed above barely scratch the surface of MasterBrowse!

[This is not an advertisement - MasterBrowse comes free of charge,
although people who send in donations get bonus programs and an
optimized (a little faster and smaller), personalized version of
MasterBrowse.]

MasterBrowse has been sent to comp.binaries.atari.st and the
atari.archive mail/FTP (mbrowse.zoo or MBROWSE.ZOO) site.

My UK verson 2.2 has Times, Triumverate and Garamond compugraphic
fonts, and several SoftLogik fonts (can't remember which ones), but no
Typewriter font, and no fixed pitch font.

6167. GFA Help! (Damned compiler!)

Newsgroup: comp.sys.atari.st
Date: 1993-04-28 12:25:39 UTC
From: ggranger@ersys.edmonton.ab.ca
Message-ID: <g2uP3B1w165w@ersys.edmonton.ab.ca>
Source record: 206745
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have the following GFA Basic code as part of a program to track
lottery numbers:

```
totalcount=16
DIM mstrip$(totalcount+1)
RESTORE strip_data
FOR i%=1 TO totalcount+1
READ mstrip$(i%)
NEXT i%
strip_data:
DATA Desk , Lotto 6/49 Tracker ,------------------,1,2,3,4,5,6,""
DATA Numbers , Get occurences , Enter lotto numbers , Check lotto numbers , Exit
,""
DATA "","
```

Now, here's my dilemna. It works fine when being run in the GFA
Basic editor, but when it is compiled, it gives me an address error
(3 bombs). I don't understand why it would give me that error. I
have an OPTION BASE 1 statement in my INIT module (if that helps).
Any help would be greatly appreciated, as I am nearly to the end of
my rope with this bug.

```

Ok, multiTOS doesn't have VM by default, but there are VM drivers available for
it (check out OUTSIDE) if you own a TT/F030.

6170. Falcon serial == ST serial?

Newsgroup: comp.sys.atari.st
Date: 1993-04-28 13:29:45 UTC
From: thumpy@dcs.qmw.ac.uk
Message-ID: <C6745M.47n@dcs.qmw.ac.uk>
Source record: 206744

Obviously the Falcon serial port is physically dissimilar from the old ST one, (it's short by around 16 pins), but I'm just wondering if the two are otherwise the same? Specifically what I want to do is add an additional MIDI out port to my Cubase set-up... can I just buy a 9-25 pin RS-232 converter and plug in something like MODEMMIDI that usually plugs into the ST serial port?

Thanks for any suggestions...

Hi !
I was just reading somebody complaing about CoNnect (BTW where can I FTP
the latest version ?), and I felt the strong urge to defend that program.

I use it daily (or used to since I got no phone now :( ) and I think it is
the best terminal program there is, and I tried a lot. It is a clean GEM-
application and has everything one possibly will need. There are regular
updates and the handbook (in German :)) is well written.

DO give it a try, you will never use anything else.

BTW:I am not related to the author in any way, but I just thought it unfair
to start a discussion about nothing.

The only way I know of (and somebody please correct me if I'm wrong), is to number one, get the Atari Macintosh emulator called Spectre GCR, and also use a relatively new application called "MacSee", which converts Mac files saved in ASSCI format to Atari files, and vice versa. Spectre GCR also has a so-called "transverter" program, but I had no luck with it on my Mega STe. I also found that "MacSee" had some bugs, but did work. I can't remember the name of the maker of "MacSee". I have it at home. Good luck :-) Mark van Wyk

I wondering if someone could help me with a little problem I got.
My girlfriend uses a PC to write reports at school, but would like to
sit at home to work on them in the evening. The problem is that she
is using Word Perfect for her reports and I cant load them into any of
the wordprocessing programs I got at home.

My question is this: Does there exist a program on the ST which reads
and writes Word Perfect files(v5.1 I think)? Or a program which can
convert WP files to a common ST format?

I really hope that it does, because she is threathening me to buy a PC(cant
understand why, really) :)

There's a utility by Robert Best that converts between WP5 and First Word Plus (not graphics). Email him on mbdqbest@diamond.sara.nl (costs about $20 I think - pretty steep).

If WP5 takes Rich Text Format (RTF) there's a small utility on atari.archive called 1wp2rtf.zoo to convert at least _from_ Wordplus to RTF.

Finally there's Redacteur3, a wordprocessor that reads/writes Word Perfect files. Prices range from #39 (junior version) to #99 (full version) (about US$60 - 150). Not a cheap option, but its supposed to be a very good WP, and not as much as a new PC :-)

regards,

Sam

Old news, Kevin. EA stopped support for the Atari ages ago.

>Did atari try to talk to them about developing on the Falcon030? Or is that
>someone else... thanx.

I doubt seriously if Atari has talked to them. And you can bet that EA will
not seriously consider supporting the Falcon until there have been thousands
of them sold. It costs just as much to develop (or port) a game for the Atari
as it does for any other platform so why should they do it for so little return?

Just to let y'all know, CompuSeller West in St. Charles, Il got their demo unit in last week Thursday. 4M with a 65M HD. Software that we have heard would be included was - - - except for D2D. My son and I tested a few packages and they worked great - although we often had to disable MTOS to get them to work. We also tested a couple that didn't work and we didn't try much else to try to get them up so I wouldn't say they don't work - just don't work under the conditions we attempted to run them under. CompuSeller West expects saleable units in about 3 Atari weeks (you know what that means.)

Was I excited - you bet. Haven't felt that good about my computing since Dave Small's Spectre GCR. Hope all your local dealer's get their demo units in so we too can join the rest of the world in exploring this new beast. Wayne Booth

Well, a few reasons come to me:

- A person works with MS-DOS machines at work, and on occasion have to
do work at home with those same MS-DOS programs (eg 1-2-3, etc.).

- The user can't live without some of the programs (games, etc.) that
(for some reason, ummm, larger market?) won't get released on the
Falcon platform.

- The user just plain likes little gadgets just so they can say `My
computer will out emulate your computer'.

With the ability of Falcon to read/write MS-DOS compatible disks, and
the possibility of Falcon being able to do close to `real' thing's
speed, etc. emulation, it doesn't sound like a bad thing to have
around. And saves some room at home to boot!

Actually, what worries me is if the 9-25 converter will work on the
Hybrid Arts SMPTE box. I know they use some of the extra signals on the
DB 25 connector to work.

I just tried to reproduce this bug, and I was successful. And when I tried to analyze where the bombs occurred, I was even more surprised: After inserting a diagnostic PRINT statement between all lines of the above program, the bug had disappeared -- no bombs anymore.
I can dimly recall that I ran into a similar problem quite a while ago, the exact situation escapes me right now. Back then, my solution was to insert dummy statements into the program until it worked, as far as I recall. I'm afraid the only "real" solution to such weird compiler problems will be to wait for the release of the Richter version of GFA basic.

[...]

>The more I use GFA Basic, the more I hate that stinking language!

Come on... the compiler is doubtlessly rotten, but the language
is one of the most elegant ones around. As an example, just
compare

```
DIM a&(x&,y&)
```

to:

```
int **a;

a = (int **) malloc(x * sizeof(int *)); /* this piece of code is */
a[0] = (int *) malloc(x * y * sizeof(int)); /* after an example given */
for (i = 1; i < x; i++) /* in some FAQ file about C */
a[i] = a[0] + i * y; /* off the top of my head */
```

I really do hope that the Richter version of GFA will turn out to
be as good as it sounds. At the CeBIT, I was thold by Mr. Richter
himself that the compiler they are building is based on the GNU
compiler. If they do that properly, we may soon see the
convenience of GFA combined with the power of GNU.

>port?

I'm not familiar with the MIDI out, but assuming it doesn't use any
pins other than what most modems use, it might work.

The MegaSTe (and alot of newer PC's) use the 9-pin serial port (this
caught me by surprise when I upgraded from a 1040ST to my MSTE - had to
got and get a new cable (or 9-25pin converter)). I guess they did the
same with the Falcon. (actually, the MSTE have 3 of these ports, 1 being
on the VME slot). I suppose not enough people made use of the other
lines...

Which version of the transverter do you have? I've had no problem
using 4.50 with my MegaSTe, though I *cannot* get 4.51 to work on it
(some real funky error message appears). Anyways, you might try
a different version of the transverter...

Ok, I've posted this message acrose the 3 main atari groups.

Is there a good history of atari and its machines?
Here is what I have constructed from word of mouth, my memory and old
issues of Compute!.

1. Early 70's. Atari founded by Bushnell releases the pong arcade game. It
was a use sucess and atari began its climb.
2. 1976, Atari had made a cartridge game system called the VCS (Video computer
system, later called the 2600). However it took a year to reach to market
because most stores didn't think people would buy such an expensive toy.
3. 1979, the VCS was a huge success. With the release of the Apple, Atari
started to develop its own home computer. I'm not sure when the 400 was
released but I assume before 1981.
The computer they release was the 400. it has 16k ram and uses the 6502
chip for the CPU. As far as I can tell it ran a 1 mhz. An upgrade
version called the 800 was released with a real keyboard and 48 k ram.
4. 1983. While the computers sold well, they appear to be losing a war against
the commadore 64 and other computers. And while their billion dollar baby
the VCS keeps making money, systems like the Intellivision, Collecovision
, computers and time itself has warn it down.
(at some tome they released the 5200. A video game system based on the
atari 400. I'm not sure when this happened. It was a failer)
5. 1984. The video game industry when bust and alot of companies where
destoryed by it. The company that own it, warner bros sold it to Jack Tramiel
in mid 84.
Also, atari developed the 7800. a revolutionary game system that was delayed
for so long ~(I think 86 was when it offical was released in real numbers and`
the nintendo, a surperior machine, although also developed in 84 had bet them
to the punch)
5. 1985. With the winter CES Tramiel Atari released the 130ST, the 520 ST and
the 65 XE. The ST line (ST stands for Sixteen/Thirtytwo) were revolutionary
machines that were twice as power as anything else on the market. They used
the GEM windowing system and had Color and used the 68000 chip. They were
nick-named the Jackintosh.
The 65 XE and the 130 XE were updated 8bit versions of the 800xl. I can't
find what xl were released and when.
6. the time between 86 and 91 is very hard for me to track info down. I was
very into the IBM PC world and got few mags that said anything about Atari.
I do know at some time the 5200 and 2600 (VCS) were dropped. The 8bit
line was taken down to one game computer called the XEGS. And ST's didn't
sell well or were run over by PCs Also there were other ST models released
called 1024, STE, and the TT.
7. 1991. Atari bought the Lynx hand held game system from EPXY and cannceled

the 7800 and the XEGS.
8. 1992 to present. Things look pretty bad..

ok, anyone care to fill in details or point out my mistakes in the time line?

GNU find is OK, but you need GCC to compile it. You probably also need to hand-configure the Makefiles (I never found a shell that could handle GNU configure scripts).

Greetings,

Jens.

YES! That could be the reason for a mysterious bug I've been hunting these last weeks.

More strange behavior: On my ST, TOSWIN immediately opens its file selector and crashes if I use another accessory beside it. With three accesories, the system comes up, but crashes when I try to start a program.

If anybody has a fix (or even just a suggestions for the cause of the problem), *please* make it public.

Jens.

PS: Claus - ich muss Dich wohl um Entschuldigung bitten :-)

is there a source for all the f.a.q. guides that apply to the atari? if not maybe anyone who has an atari-faq could mail it to my?

thanks.

The TT's could not compete with the A3000 and the MAC SI in the same price range. I remember those days about the delivery date of the TT. Atari said: Real soon now.....Same thing happen with the Falcon.

I remember the day when Apple introduced the MAC SI on October 15, 1990. That day you could walk into the dealer and take one home. Apple sold about a million Si's versus 800 TT's in North America..

By the time an 040 Falcon comes out: Did someone say Power PC....

Atari should produce a Power PC box and all the the Atari users whould buy one because its from Atari..
